English	17-Mar-17	<p>Hello, I appreciate the SMT website and the ability to get on-demand reads. I wanted to offer a feature suggestion. There are several electricity plans that have a minimum usage requirement. It would be very cool if SMT had a feature where I could plug in my billing period start/end dates and my electricity target usage goal in KWH and get daily status update emails that would provide me information that I could use to pace myself and adjust my energy usage in order to hit the target. For example, the email could contain a projection of how much more/less energy I would need to use each day in the rest of the period, on average, in order to achieve my usage goal. I think this would be a really useful feature for folks on these types of plans. Thanks,</p> <p>Caleb Pippin</p>
English	15-Mar-17	<p>I have a large solar panel array producing about 50 kW Hours per day between 9:00 AM and 10:45 PM. However all of the 15 minute data capture increments during this period show 0.0 kW Hours rather than negative kW hours indicating solar production that should be deducted from my usage. Thus during these cool Spring days in Texas I should be running my meter backward; but, this is not the case for the Smart Meter measurements I always show a positive consumption from Oncor. This is not correct. Does anyone have experience in this area and how to correct it. Also my bills from my REP XXXXX are in error!</p>
