

Release Date: March 1, 2018

**PRELIMINARY**  
**Seasonal Assessment of Resource Adequacy for the ERCOT Region (SARA)**  
**Summer 2018**

## SUMMARY

ERCOT is predicting record-breaking peak usage this summer season (June – September 2018). The strong Texas economy continues to drive demand in the ERCOT Region, and the anticipated peak demand is expected to be more than 1,600 MW higher than the all-time peak demand record of 71,110 MW set in August 2016.

This anticipated record demand, combined with recent plant retirements and delays in some planned resources, is expected to result in tight reserves that could trigger the need for ERCOT to deploy such resources as Ancillary Services and contracted Emergency Response Service capacity to maintain sufficient operating reserve levels. ERCOT may also request that Transmission and/or Distribution Service Providers (TDSPs) implement load control measures established through Standard Offer contracts with their customers. Based on the December 2017 Capacity, Demand and Reserves Report, there is approximately 2,300 MW of such additional capacity available to ERCOT for addressing reserve deficiency situations. ERCOT also anticipates further voluntary load reductions and an increase in power sold in the market by industrial facilities in response to higher power prices during peak demand.

This preliminary report includes a 72,974 MW summer peak load forecast based on normal weather for years 2002-2016 and an adjustment reflecting additional load from the Freeport Liquefied Natural Gas project that is currently under construction\*. For this SARA report, the forecast was lowered by 218 MW due to a recently announced delay in the operations date for the first production unit of the LNG project. The total resource capacity available for the upcoming summer is 77,658 MW.

Planned capacity additions expected to be in service before the start of the summer season include 130 MW of gas-fired generation (based on summer ratings), 660 MW of wind with a summer peak capacity contribution of 92 MW, and 387 MW of solar with a summer peak capacity contribution of 291 MW.

The resource adequacy scenarios for this report include a unit outage forecast of 4,349 MW based on average seasonal historical outages for the last three summer seasons. ERCOT also includes a scenario combining the peak load forecast with an extremely low wind output of 798 MW.

\*Details on the load forecast methodology:

**Seasonal Assessment of Resource Adequacy for the ERCOT Region**  
**Summer 2018 - Preliminary**  
**Release Date: March 1, 2018**

**Forecasted Capacity and Demand**

Operational Resources (thermal and hydro), MW	65,694	Based on current Seasonal Maximum Sustainable Limits reported through the unit registration process
Switchable Capacity Total, MW	3,516	Installed capacity of units that can interconnect with other Regions and are available to ERCOT
Less Switchable Capacity Unavailable to ERCOT, MW	-844	Based on survey responses of Switchable Resource owners
Available Mothball Resources, MW	118	Based on seasonal Mothball units plus Probability of Return responses of Mothball Resource owners
Private Use Network Capacity Contribution, MW	3,341	Average capability of the top 20 hours in the summer peak seasons for the past three years (2015-2017)
Non-Coastal Wind Resources Capacity Contribution, MW	2,557	Based on 14% of installed capacity for non-coastal wind resources per ERCOT Nodal Protocols Section 3.2.6.2.2
Coastal Wind Resources Capacity Contribution, MW	1,546	Based on 59% of installed capacity for coastal wind resources per ERCOT Nodal Protocols Section 3.2.6.2.2
Solar Utility-Scale, Peak Average Capacity Contribution, MW	829	Based on 75% of rated capacity for solar resources per Nodal Protocols Section 3.2.6.2.2
RMR Resources to be under Contract, MW	0	
Non-Synchronous Ties Capacity Contribution, MW	389	Average capability of the top 20 hours in the summer peak seasons for the past three years (2015-2017)
Planned Thermal Resources with Signed IA, Air Permits and Adeq. Water Supplies, MW	130	Based on in-service dates provided by developers
Planned Non-Coastal Wind with signed IA , MW	92	Based on in-service dates provided by developers and 14% of installed capacity for non-coastal wind resources
Planned Coastal Wind with signed IA , MW	0	Based on in-service dates provided by developers and 59% of installed capacity for coastal wind resources
Planned Solar Utility-Scale with signed IA, MW	291	Based on 75% of rated capacity for solar resources per Nodal Protocols Section 3.2.6.2.2
<b>[a] Total Resources, MW</b>	<b>77,658</b>	
Peak Demand, MW	72,974	Based on average weather peak conditions from 2002 – 2016
Less Freeport LNG facility load decrease	-218	Reported delay in the commercial operations date for the Freeport Liquified Natural Gas facility expansion project
<b>[b] Adjusted Peak Demand, MW</b>	<b>72,756</b>	
<b>[c] Reserve Capacity [a - b], MW</b>	<b>4,902</b>	

**Range of Potential Risks**

	Forecasted Season Peak Load / Typical Generation Outages	Forecasted Season Peak Load / Extreme Generation Outages	Forecasted Season Peak Load / Extreme Low Wind Output	Extreme Season Peak Load / Typical Generation Outages	
Seasonal Load Adjustment	-	-	-	3,202	Based on extreme weather conditions using 2011's weather; the extreme winter forecast is 76,176 MW
Typical Maintenance Outages	455	455	455	455	Based on historical average of planned outages for June through September weekdays (starting in February 2012)
Typical Forced Outages, Thermal	3,894	3,894	3,894	3,894	Based on historical average of forced outages for June through September weekdays (starting in February 2012)
90th Percentile Forced Outages, Thermal	-	2,566	-	-	Based on historical forced outages assuming a 90% confidence interval
Low Wind Output Adjustment	-	-	3,397	-	Based on the 10th percentile of wind output associated with the 100 highest Net Load hours (Load minus wind output) for the 2013-2016 summer Peak Load seasons; this wind output level is 798 MW
<b>[d] Total Uses of Reserve Capacity</b>	<b>4,349</b>	<b>6,915</b>	<b>7,746</b>	<b>7,551</b>	
<b>[e] Capacity Available for Operating Reserves, Normal Operating Conditions (c-d), MW</b>	<b>553</b>	<b>(2,013)</b>	<b>(2,844)</b>	<b>(2,649)</b>	See the Background tab for additional details Less than 2,300 MW indicates risk of EEA1

## Seasonal Assessment of Resource Adequacy for the ERCOT Region

### Background

The Seasonal Assessment of Resource Adequacy (SARA) report is a deterministic approach to considering the impact of potential variables that may affect the sufficiency of installed resources to meet the peak electrical demand on the ERCOT System during a particular season.

The standard approach to assessing resource adequacy for one or more years into the future is to account for projected load and resources on a normalized basis and to require sufficient reserves (resources in excess of peak demand, on this normalized basis) to cover the uncertainty in peak demand and resource availability to meet a probabilistic reliability standard.

For seasonal assessments that look ahead less than a year, specific information may be available (such as seasonal climate forecasts or anticipated common-mode events such as drought) which can be used to consider the range of resource adequacy in a more deterministic manner.

The SARA report focuses on the availability of sufficient operating reserves to avoid emergency actions such as deployment of voluntary load reduction resources. It uses an operating reserve threshold of 2,300 MW to indicate the risk that an Energy Emergency Alert Level 1 (EEA1) may be triggered during the time of the forecasted seasonal peak load. This threshold level is intended to be roughly analogous to the 2,300 MW Physical Responsive Capability (PRC) threshold for EEA1. However, PRC is a real-time capability measure for Resources that can quickly respond to system disturbances. In contrast, the SARA operating reserve reflects additional capability assumed to be available before energy emergency procedures are initiated, such as from Resources qualified to provide non-spinning reserves. Additionally, the amount of operating reserves available may increase relative to what is included in the SARA report due to the market responding to wholesale market price increases and anticipated capacity scarcity conditions. Given these considerations, ERCOT believes that the 2,300 MW reserve capacity threshold is a reasonable indicator for the risk of Energy Emergency Alerts given the uncertainties in predicting system conditions months in advance.

The SARA report is intended to illustrate the range of resource adequacy outcomes that might occur. It serves as a situational awareness tool for ERCOT operational planning purposes, and helps fulfill the "extreme weather" resource adequacy assessment requirement per Public Utility Commission of Texas rule 25.362(i)(2)(H). In addition to a base scenario, several other scenarios are developed by varying the value of load forecast and resource availability parameters. The variation in these parameters is based on historic ranges of the parameter values or known changes expected in the near-term. The SARA report is not intended to indicate the likelihood of any of these scenario outcomes.
