Resource 301

Module 4: The Reliability Unit Commitment Process

Topics in this module ...

- Reliability Unit Commitment (RUC) Process Overview
- Formation of Resource Constraints in RUC
- The Mind of RUC
- QSE Responsibilities post-RUC

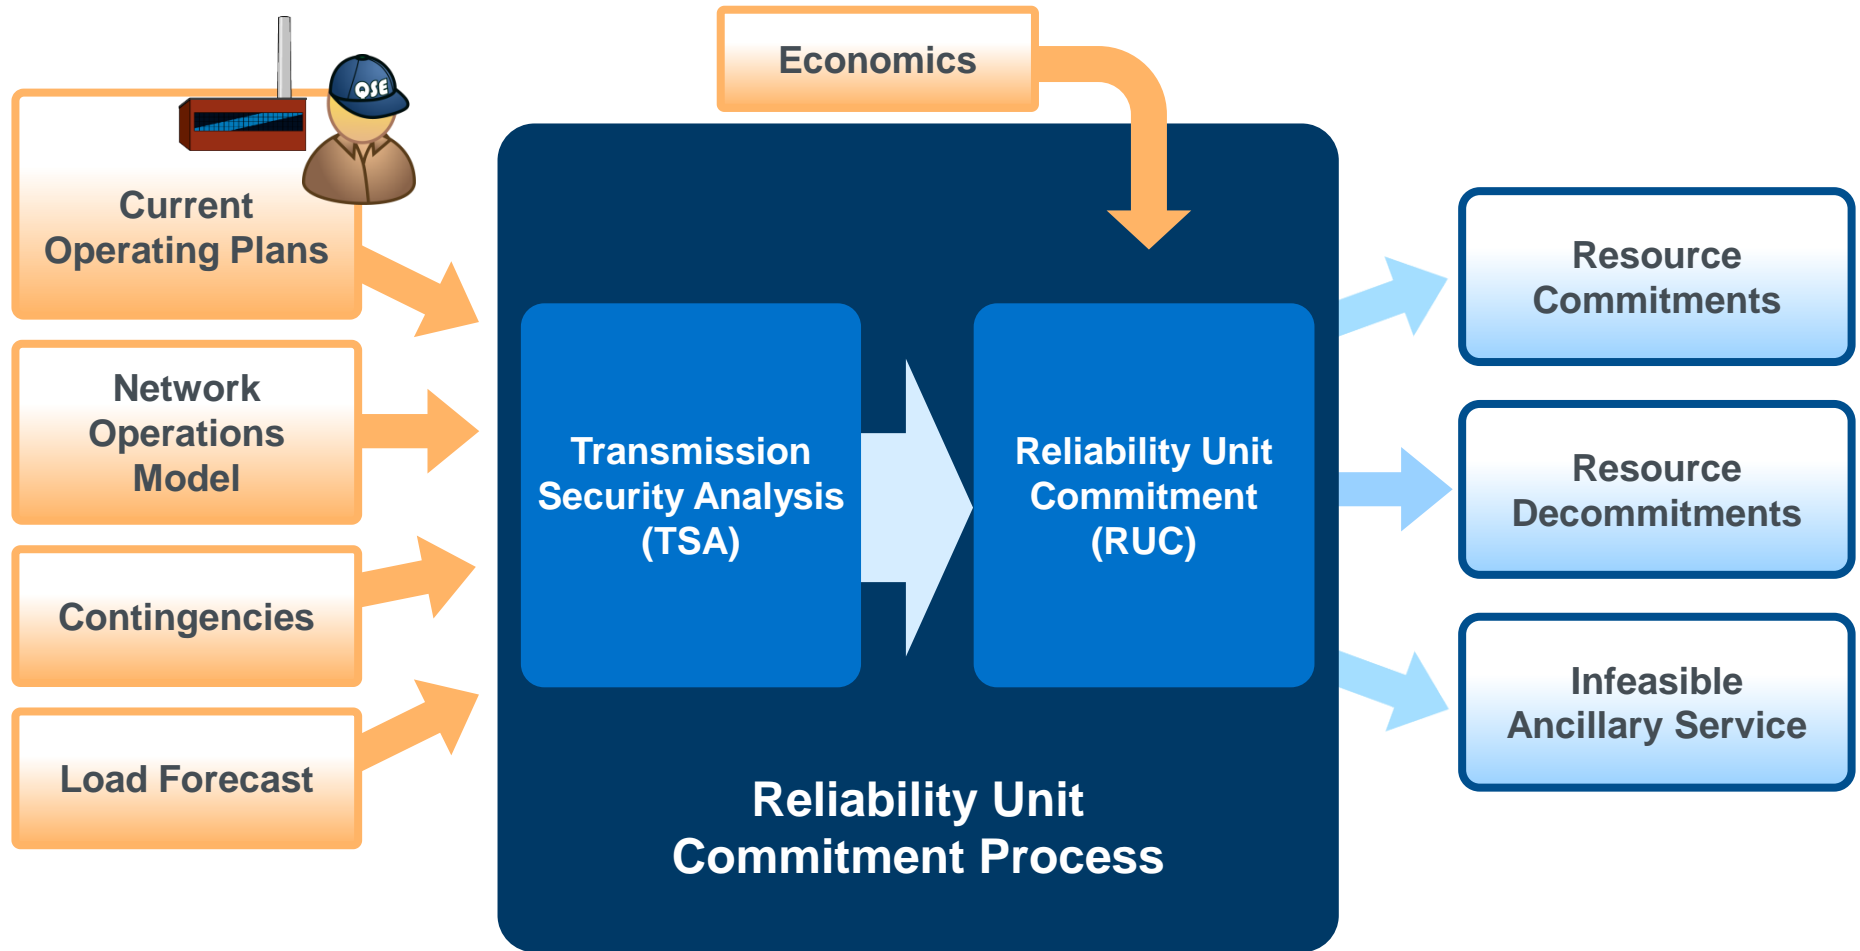

Reliability Unit Commitment Process Overview

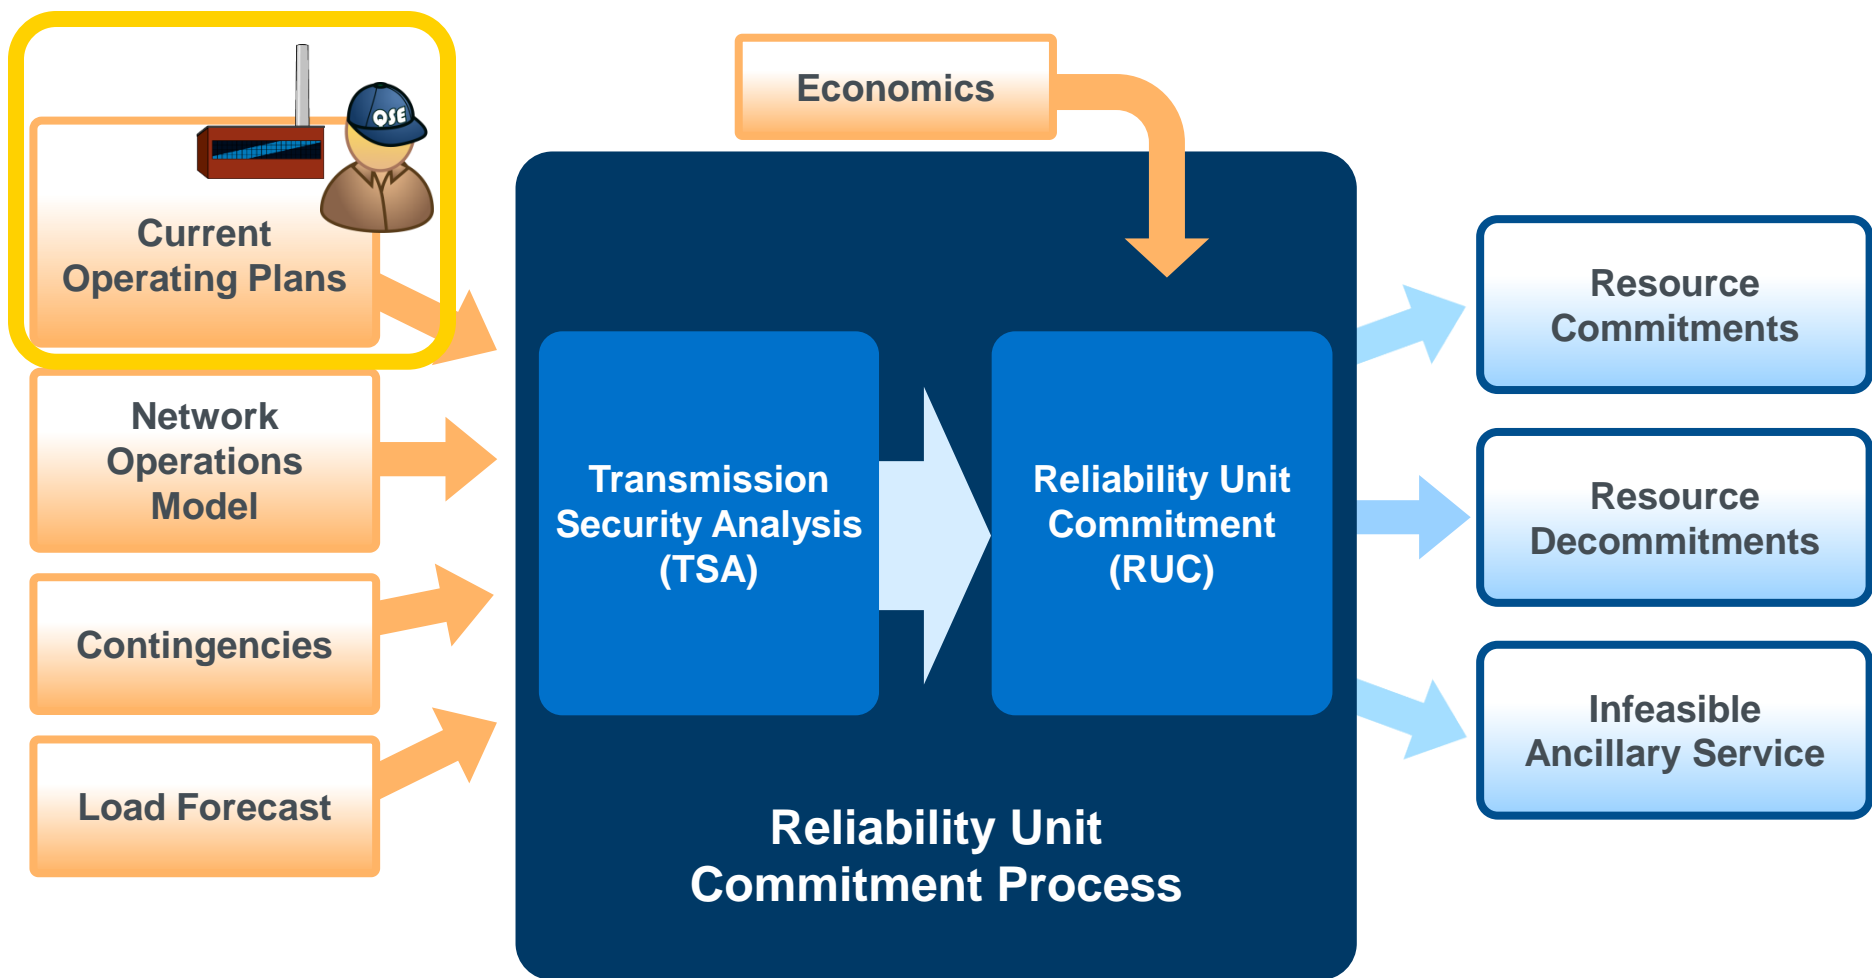

Ancillary Service Considerations

- RUC ensures enough “dispatchable” capacity to manage reliability
- Capacity reserved for Ancillary Services are unavailable to RUC

If Ancillary Service capacity is required to resolve a Transmission Constraint, then it is deemed Infeasible.

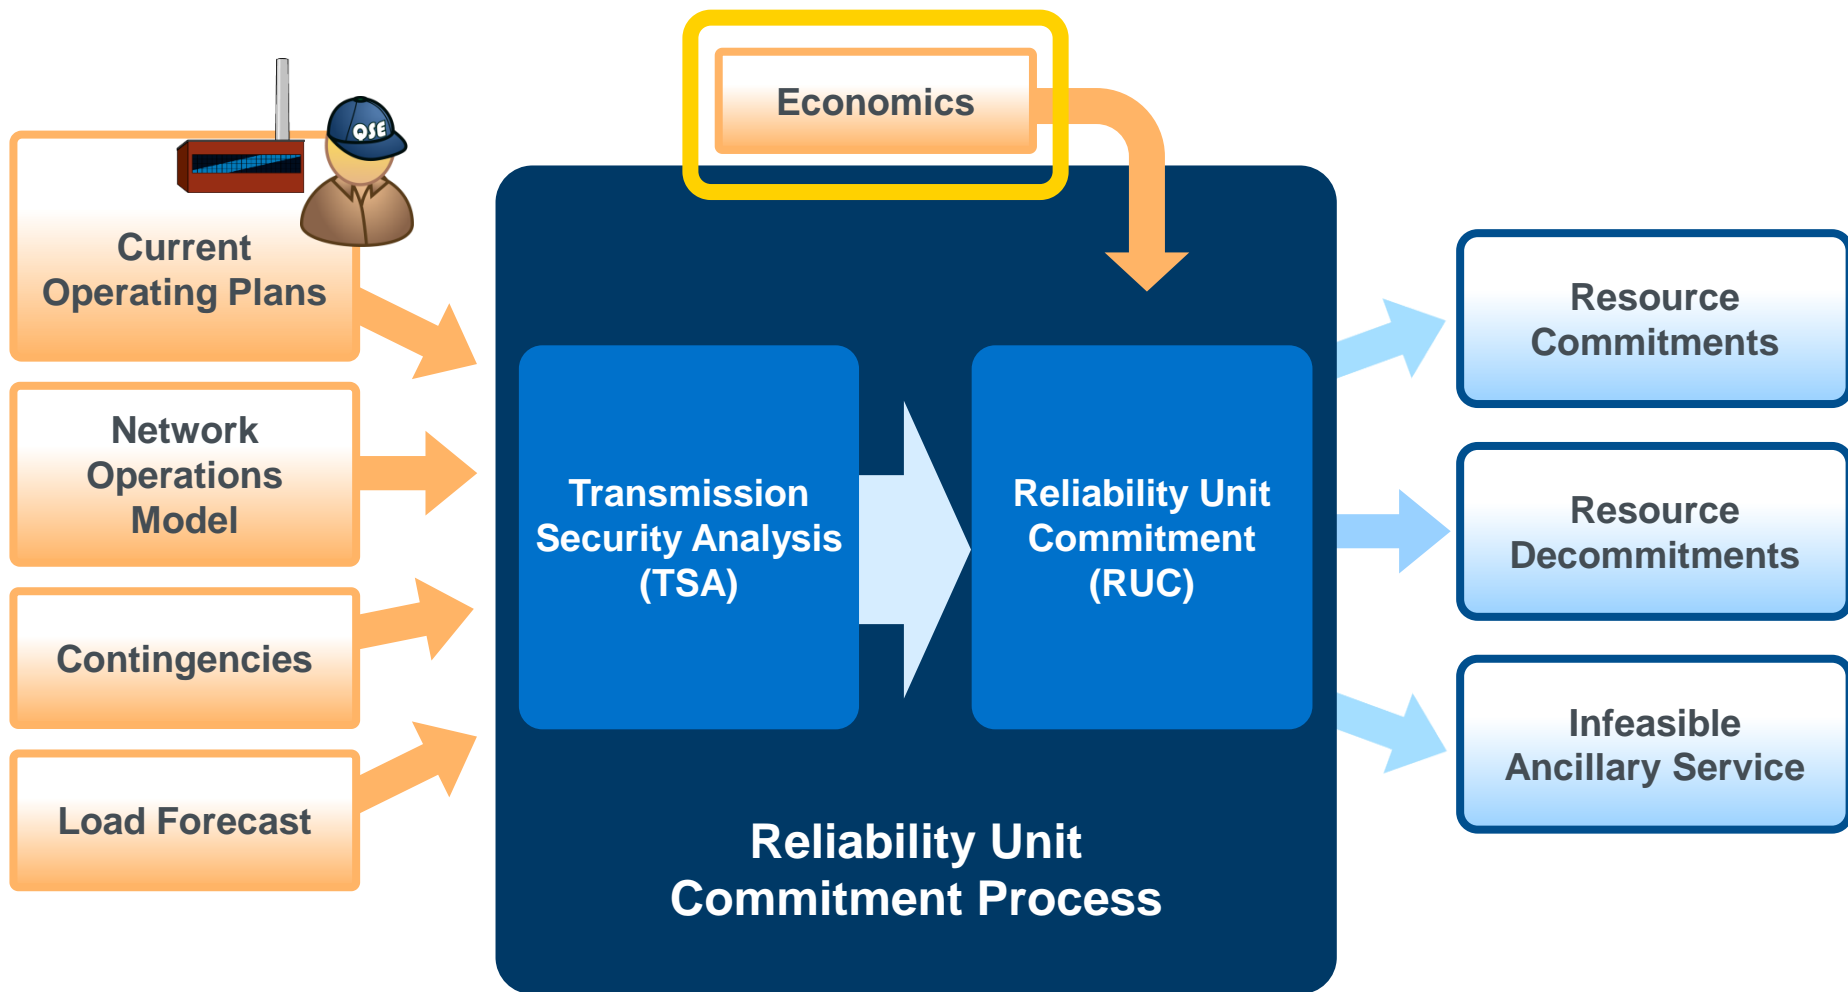

COP statuses through the eyes of RUC

- **ON** (any variety): Resource capacity is committed
- **OFF**: Resource is offline but available for RUC commitment
- **ONRR**: Resource is online acting as a synchronous condenser and available for RUC commitment
- **OUT**: Resource is not available

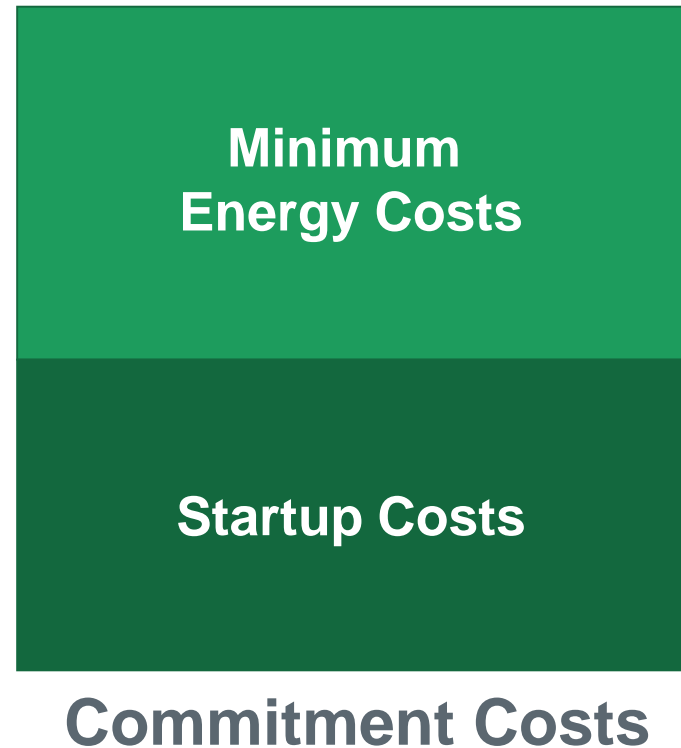

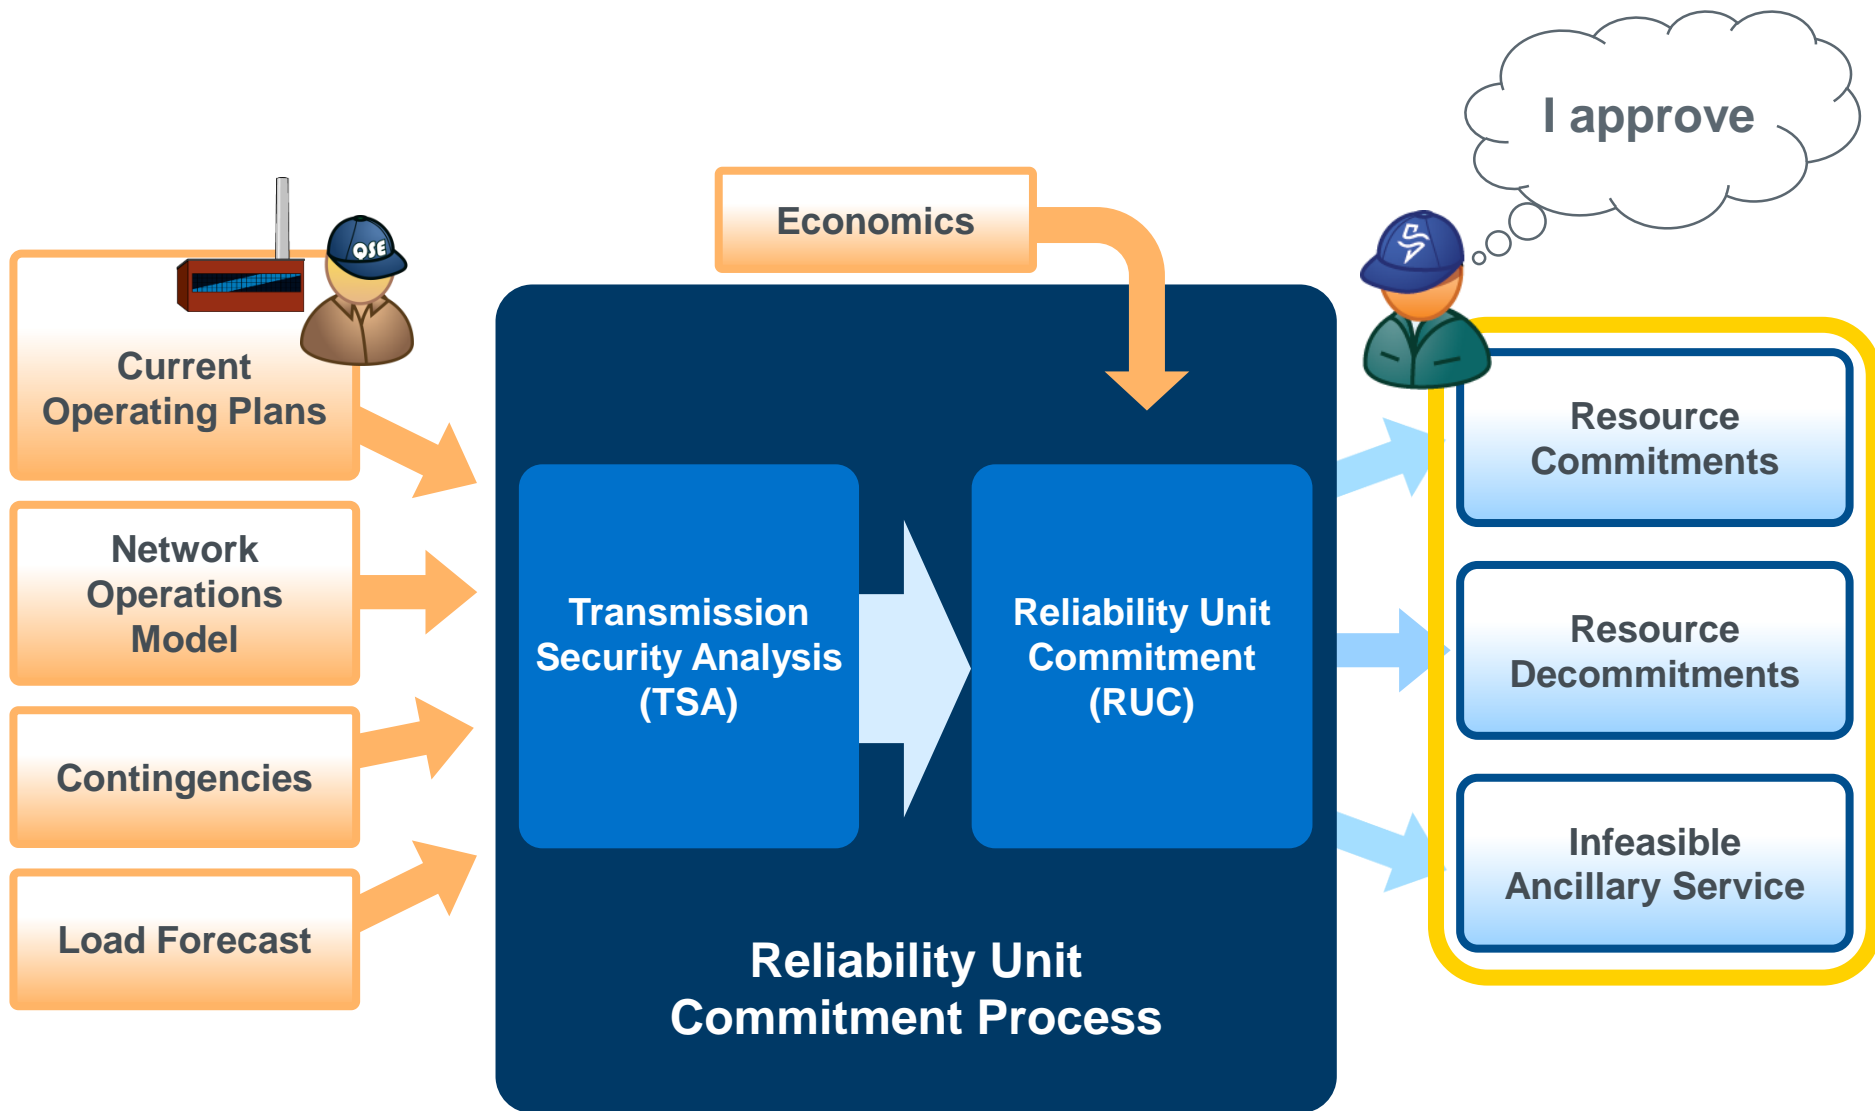

Discussion

RUC Engine Cost Optimization

- Actual costs for Start-Times > 1 hr
- Discounted costs for Start-Times ≤ 1 hr

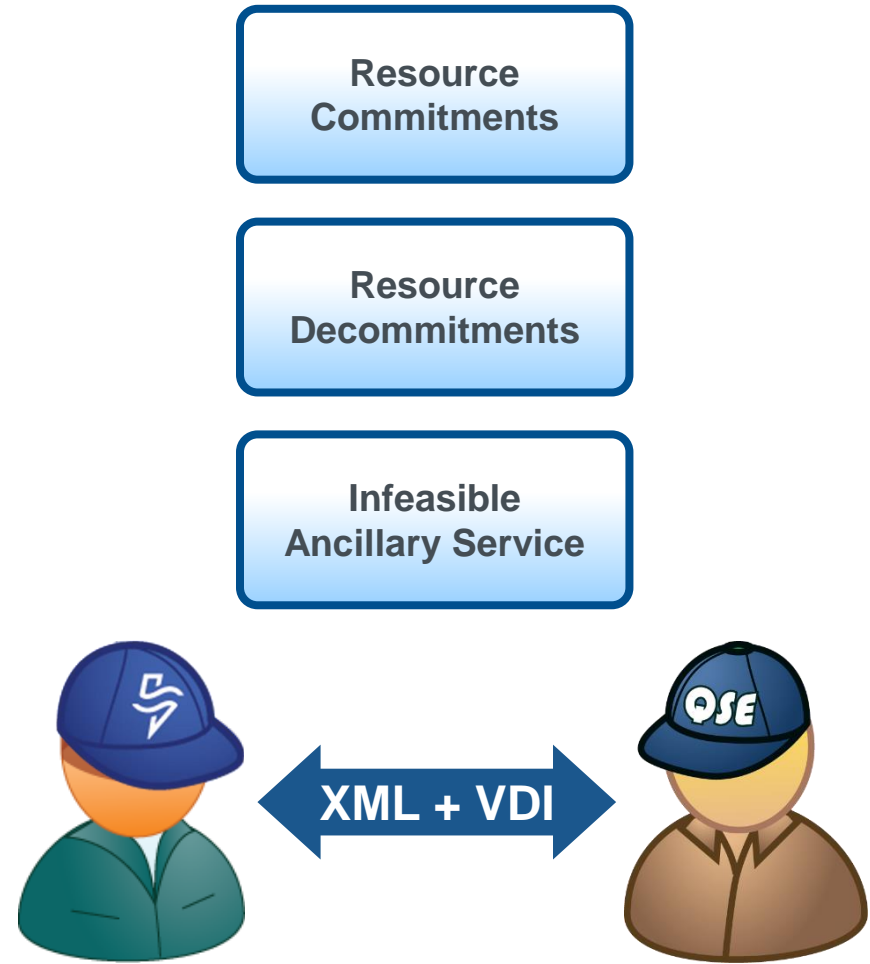

Why do this?

Communication of RUC Instructions

- RUC time stamp
- RUC Commitment
- RUC Decommitment and the corresponding reason code
- Infeasible Ancillary Service Capacity

Formation of Resource Constraints in RUC

Topics in this Section Include

1

Temporal Constraints

2

Combined Cycle Transitions

3

Split Generation Resources

RUC will enforce the following Temporal Constraints for Available Resources

- Start Time (Hot, Intermediate or Cold)
- Min On-Line Time
- Max On-Line Time
- Min Off-Line Time
- Maximum Daily Starts

Topics in this Section Include

1

Temporal Constraints

2

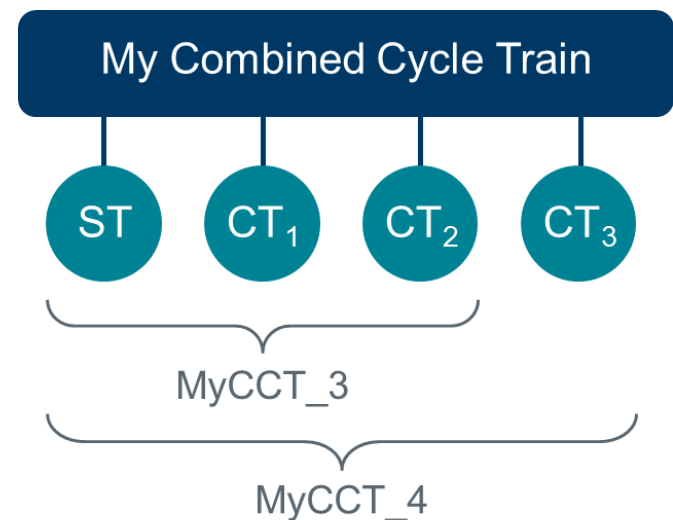

Combined Cycle Transitions

3

Split Generation Resources

Committing Combined Cycle Plants in RUC

- QSE may make any configurations available
- RUC may commit
 - One configuration per hour
 - Transitions per registered transition matrix

Topics in this Section Include

1

Temporal Constraints

2

Combined Cycle Transitions

3

Split Generation Resources

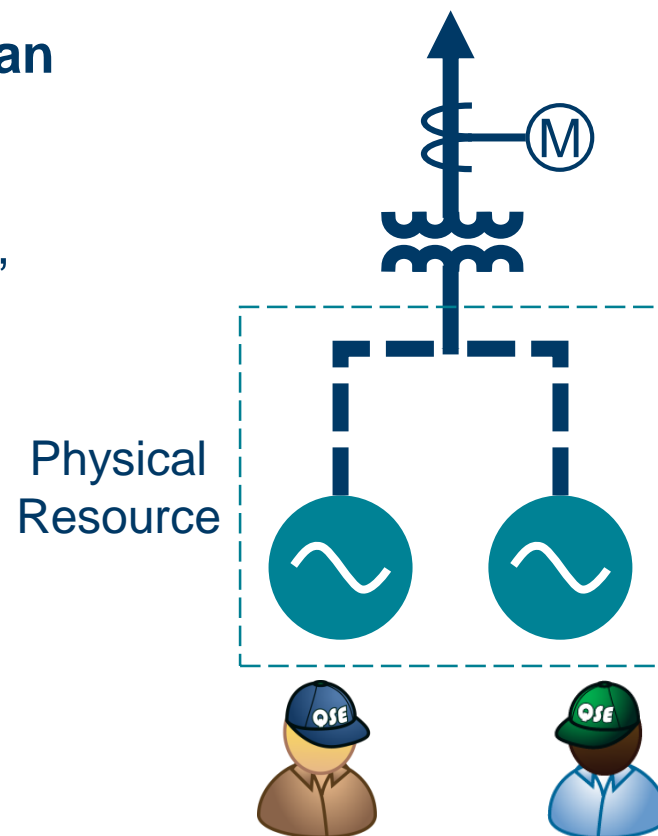

Example

Resource MPD is set up as two Split Generation Resources (SGR)

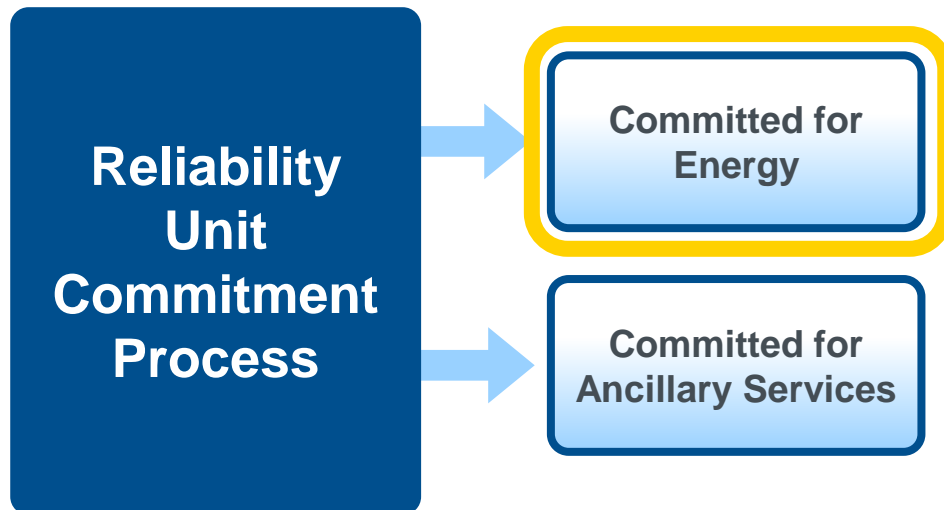

Each QSE provides a Current Operating Plan

- If one SGR is “OUT,” all are “OUT”
- Otherwise, if one SGR is “ON,” all are “ON”

Suppose each QSE shows a COP Status of “OFF.” Can RUC commit just one SGR?

QSE Responsibilities Post-RUC

QSE must update COP within 60 minutes

- ONRUC
- ONOPTOUT

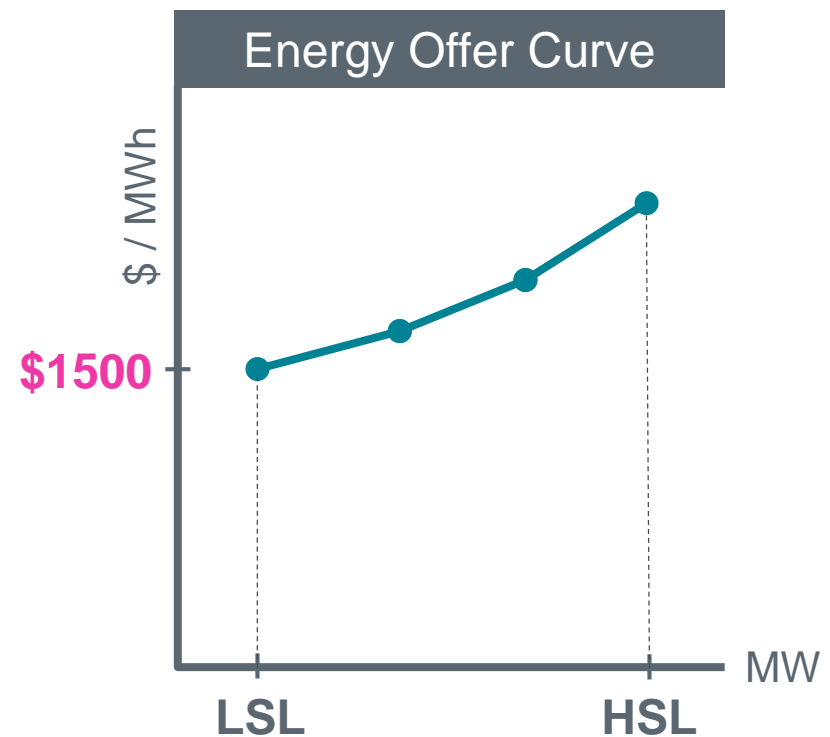

Resource must run during instructed hours

Energy Offer Curve for RUC-Committed Resource

- All energy above LSL subject to offer floor
- QSE may update by end of Adjustment Period
- ERCOT will adjust if QSE does not

Applies only to hours in the RUC-commitment Period

A QSE is “Buying-Back” the RUC Commitment

Operational impacts

- Must start/run resource if available
- May provide Ancillary Services

Financial impacts

- No RUC financial settlements apply
- No requirement for energy to be priced at or above \$1500

Telemetry Requirements and Confirmation

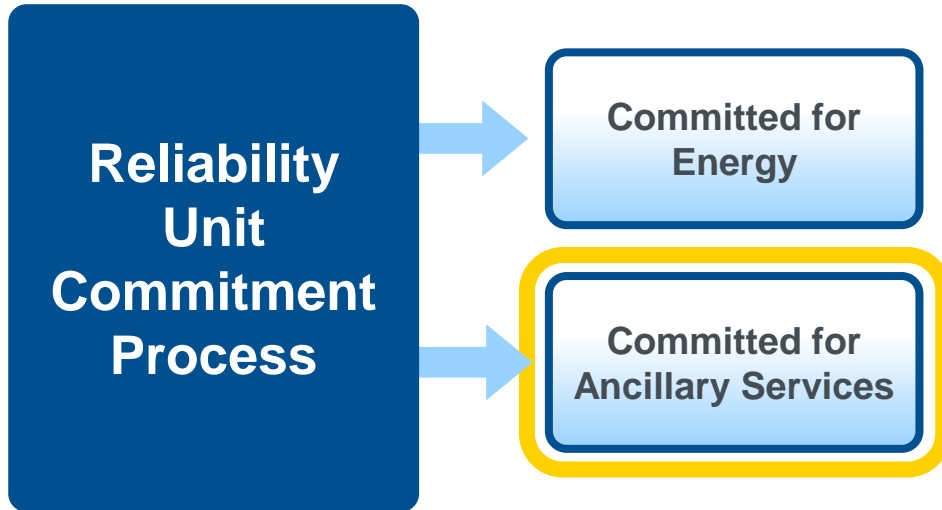

QSE requirements

- Must telemeter ONOPTOUT status
 - First SCED run Resource is available for dispatch
 - First hour of RUC Commitment

ERCOT requirements

- Set Buy-Back flag to “1”
- Send XML confirmation to QSE

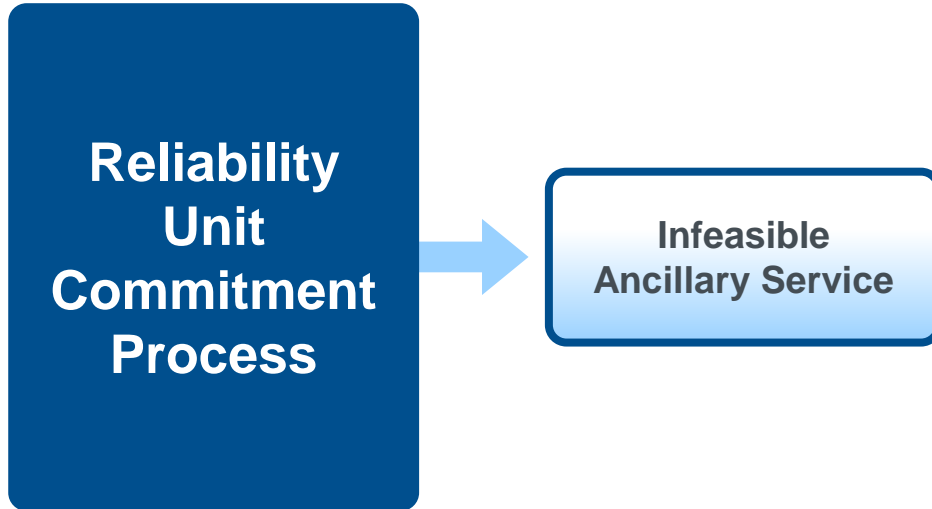

QSE must update COP within 60 minutes

- ONRUC
- ONOPTOUT

QSE must reserve Ancillary Services on appropriate Resources

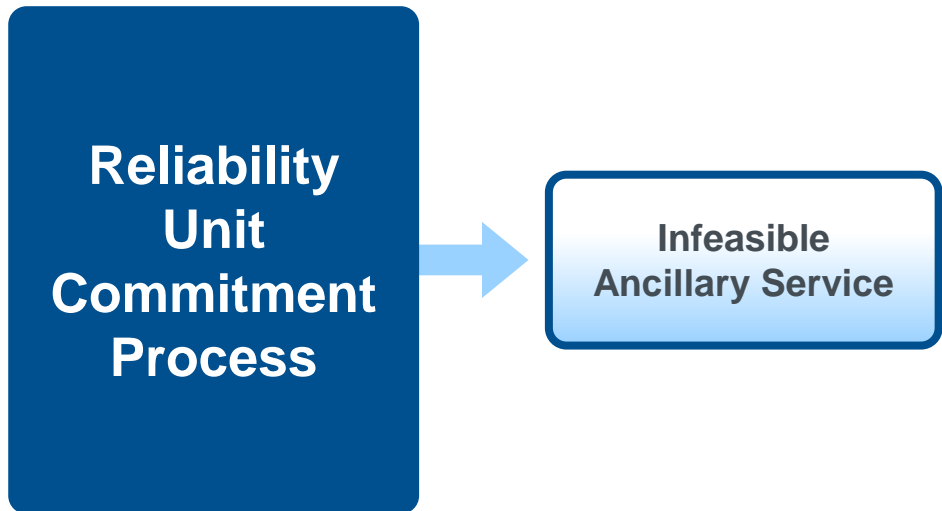

QSE may choose to

- Substitute
- Trade
- Instruct ERCOT to replace

Infeasible Ancillary Services replaced through Supplemental Ancillary Services Market (SASM)

Financial impacts

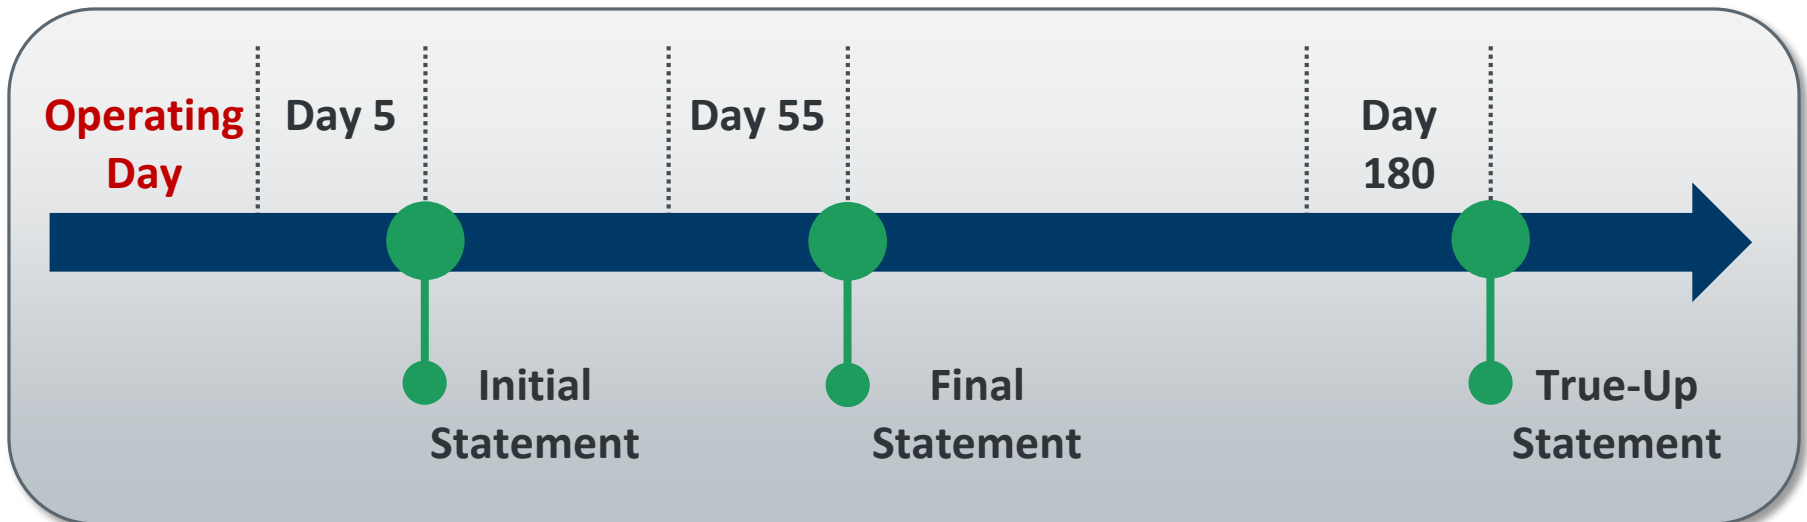

- Return anything they were paid in DAM
- Still responsible for any Ancillary Service Obligations they have

Infeasible Ancillary Services replaced through Supplemental Ancillary Services Market (SASM)

Settlement of RUC-Committed Resources included with Real-Time Settlements

We will return to this topic later!

You've learned about ...

- The Reliability Unit Commitment (RUC) Process
- Formation of Resource Constraints in RUC
- The Mind of RUC
- QSE Responsibilities post-RUC

Module Conclusion
