

Release Date: November 5, 2020

**PRELIMINARY
Seasonal Assessment of Resource Adequacy for the ERCOT Region (SARA)
Spring 2021**

SUMMARY

The ERCOT region is expected to have sufficient installed generating capacity to serve forecasted peak demands in the upcoming spring season, March – May 2021.

The peak demand forecast for spring 2021 was developed using Moody's economic data obtained in April 2020. Based on expected spring peak weather conditions, the preliminary spring SARA anticipates a seasonal peak demand of 64,548 MW.

This is this first spring assessment that includes a low wind output scenario, and even under this particular scenario, ERCOT anticipates there will be sufficient generation to meet the forecasted demand.

Based on ERCOT's preliminary assessment, an additional 4,262 MW of planned resource capacity comprised of gas-fired units, wind and utility-scale solar is expected to be available to meet the spring peak demand.

The report also includes a forecast of 12,124 MW of unit outages based on historical outage data from the past three spring seasons (starting with 2018), and assumes the high likelihood that the spring peak demand will occur in May.

The final spring SARA report will be released in early March 2021.

Seasonal Assessment of Resource Adequacy for the ERCOT Region
Spring 2020 - Preliminary
Release Date: November 5, 2020

Forecasted Capacity and Demand

Operational Resources (thermal and hydro), MW	65,565	Based on current Seasonal Maximum Sustainable Limits reported through the unit registration process
Switchable Capacity Total, MW	3,691	Installed capacity of units that can interconnect with other Regions and are available to ERCOT
Less Switchable Capacity Unavailable to ERCOT, MW	(558)	Based on survey responses of Switchable Resource owners
Available Mothballed Capacity, MW	0	Based on seasonal Mothball units plus Probability of Return responses of Mothball Resource owners
Capacity from Private Use Networks, MW	2,799	Average grid injection during the top 20 spring peak load hours over the last three years, plus the forecasted net change in generation capacity available to the ERCOT grid pursuant to Nodal Protocol Section 10.3.2.4.
Coastal Wind, Peak Average Capacity Contribution, MW	2,203	Based on 64% of installed capacity for coastal wind resources (spring season) per ERCOT Nodal Protocols Section 3.2.6.2.2
Panhandle Wind, Peak Average Capacity Contribution, MW	1,543	Based on 35% of installed capacity for panhandle wind resources (spring season) per ERCOT Nodal Protocols Section 3.2.6.2.2
Other Wind, Peak Average Capacity Contribution, MW	5,818	Based on 34% of installed capacity for other wind resources (spring season) per ERCOT Nodal Protocols Section 3.2.6.2.2
Solar Utility-Scale, Peak Average Capacity Contribution, MW	2,494	Based on 65% of rated capacity for solar resources (spring season) per Nodal Protocols Section 3.2.6.2.2
Storage, Peak Average Capacity Contribution, MW	0	Based on 0% of rated capacity (spring season); resources assumed to provide regulation reserves rather than sustained capacity available to meet peak loads
RMR Capacity to be under Contract	0	
Capacity Pending Retirement, MW	0	Announced retired capacity that is undergoing ERCOT grid reliability reviews pursuant to Nodal Protocol Section 3.14.1.2
Non-Synchronous Ties, Capacity Contribution, MW	838	Based on import flows during most recent Energy Emergency Alert (EEA) intervals for the spring season (Used as a proxy for the spring season due to lack of EEA intervals.)
Planned Thermal Resources with Signed IA, Air Permits and Water Rights, MW	306	Based on in-service dates provided by developers
Planned Coastal Wind with Signed IA, Peak Average Capacity Contribution, MW	809	Based on in-service dates provided by developers and 64% spring capacity contribution for coastal wind resources
Planned Panhandle Wind with Signed IA, Peak Average Capacity Contribution, MW	0	Based on in-service dates provided by developers and 35% spring capacity contribution for panhandle wind resources
Planned Other Wind with Signed IA, Peak Average Capacity Contribution, MW	1,634	Based on in-service dates provided by developers and 34% spring capacity contribution for other wind resources
Planned Solar Utility-Scale, Peak Average Capacity Contribution, MW	1,513	Based on in-service dates provided by developers and 65% spring capacity contribution for solar resources
Planned Storage, Peak Average Capacity Contribution, MW	0	Based on in-service dates provided by developers and 0% spring capacity contribution for storage resources
[a] Total Resources, MW	88,654	
[b] Peak Demand, MW	64,548	Based on average weather conditions at the time of the May peak demand from 2004 – 2018, and updated to reflect a revised economic growth forecast prepared in April 2020
[c] Reserve Capacity [a - b], MW	24,106	

Range of Potential Risks

	Forecasted Season Peak Load (May)	Forecasted April Peak Load and Typical Generation Outages During Peak Maintenance Season (March-April)	Forecasted Season Peak Load / Extreme Low Wind Output	Extreme April Peak Load and Typical Generation Outages During Peak Maintenance Season (March-April)	
Seasonal Load Adjustment	-	(9,726)	-	(4,111)	Based on a revised economic growth forecast prepared in April 2020; the April peak forecast is 54,822 MW, and the extreme April peak forecast is 60,437 MW; adjustments reflect April peak forecast for average and 90th percentile weather conditions, respectively
Typical May Maintenance Outages, Thermal	6,387	6,387	6,387	6,387	Based on historical average of planned maintenance outages for May weekdays (starting in 2018)
Typical May Forced Outages, Thermal	5,737	5,737	5,737	5,737	Based on historical average of forced outages for May weekdays (starting in 2018)
Incremental Unit Outages to Reflect April Peak Maintenance Season, Thermal	-	9,022	-	9,022	Incremental outages based on historical average of forced and planned maintenance outages for April weekdays, hours ending 3 pm - 8 pm (starting in 2018)
Low Wind Output Adjustment	-	-	9,481	-	Based on the 5th percentile of hourly wind capacity factors (output as a percentage of installed capacity) associated with the 100 highest Net Load hours (Load minus wind output) for the 2017-2020 spring Peak Load seasons; this low wind output level is 2,526 MW
[d] Total Uses of Reserve Capacity	12,124	11,419	21,604	17,034	
[e] Capacity Available for Operating Reserves, Normal Operating Conditions (c-d), MW	11,983	12,687	2,502	7,072	See the Background tab for additional details

UNIT NAME	GENERATION INTERCONNECTION PROJECT CODE	UNIT CODE	COUNTY	FUEL	CDR ZONE	START YEAR	CAPACITY (MW)
-----------	---	-----------	--------	------	----------	------------	------------------

Although seasonal capacity ratings for battery energy storage systems are reported above, the ratings are not included in the operational/planned capacity formulae. These resources are assumed to provide regulation reserves rather than sustained capacity available to meet system peak loads.

Unit Names with a (DGR) suffix are Distribution Generation Resources. A DGR fully participates in ERCOT's markets, but is connected to the Distribution System and is currently not required to go through the GINR application process.

Seasonal Assessment of Resource Adequacy for the ERCOT Region

Background

The Seasonal Assessment of Resource Adequacy (SARA) report is a deterministic approach to considering the impact of potential variables that may affect the sufficiency of installed resources to meet the peak electrical demand on the ERCOT System during a particular season.

The standard approach to assessing resource adequacy for one or more years into the future is to account for projected load and resources on a normalized basis and to require sufficient reserves (resources in excess of peak demand, on this normalized basis) to cover the uncertainty in peak demand and resource availability to meet a probabilistic reliability standard.

For seasonal assessments that look ahead less than a year, specific information may be available (such as seasonal climate forecasts or anticipated common-mode events such as drought) which can be used to consider the range of resource adequacy in a more deterministic manner.

The SARA report focuses on the availability of sufficient operating reserves to avoid emergency actions such as deployment of voluntary load reduction resources. It uses an operating reserve threshold of 2,300 MW to indicate the risk that an Energy Emergency Alert Level 1 (EEA1) may be triggered during the time of the forecasted seasonal peak load. This threshold level is intended to be roughly analogous to the 2,300 MW Physical Responsive Capability (PRC) threshold for EEA1. However, PRC is a real-time capability measure for Resources that can quickly respond to system disturbances. In contrast, the SARA operating reserve reflects additional capability assumed to be available before energy emergency procedures are initiated, such as from Resources qualified to provide non-spinning reserves. Additionally, the amount of operating reserves available may increase relative to what is included in the SARA report due to the market responding to wholesale market price increases and anticipated capacity scarcity conditions. Given these considerations, ERCOT believes that the 2,300 MW reserve capacity threshold is a reasonable indicator for the risk of Energy Emergency Alerts given the uncertainties in predicting system conditions months in advance.

The SARA report is intended to illustrate the range of resource adequacy outcomes that might occur. It serves as a situational awareness tool for ERCOT operational planning purposes, and helps fulfill the "extreme weather" resource adequacy assessment requirement per Public Utility Commission of Texas rule 25.362(i)(2)(H). In addition to a base scenario, several other scenarios are developed by varying the value of load forecast and resource availability parameters. The variation in these parameters is based on historic ranges of the parameter values or known changes expected in the near-term. The SARA report is not intended to indicate the likelihood of any of these scenario outcomes.
