

Release Date: September 3, 2021

**Final  
Seasonal Assessment of Resource Adequacy for the ERCOT Region (SARA)  
Fall 2021**

## **SUMMARY**

The ERCOT region is expected to have sufficient installed generating capacity to serve peak demands in the upcoming fall season, October – November 2021, under normal system conditions and several of the capacity reserve risk scenarios examined.

Based on expected fall peak weather conditions, the preliminary fall SARA anticipates a seasonal peak demand of 62,662 MW, which is unchanged from the preliminary SARA released on May 6th. This demand forecast has been adjusted downward by 120 MW to account for the load reduction impact of incremental forecasted rooftop solar capacity.

ERCOT is projecting a decrease in reserve capacity of 868 MW since the release of the preliminary fall SARA in May, based on data provided by resource owners and developers. The decrease is mostly due to an extended outage for a coal unit. Planned resource capacity totaling 5,277 MW is expected to be available to meet the fall peak demand. The planned projects are comprised of gas-fired units, wind and utility-scale solar. Another 644 MW of battery energy storage capacity is also expected to be available, although this capacity is currently assumed to provide Ancillary Services rather than sustained capacity for meeting system peak loads.

The report includes a thermal outage forecast of 14,774 MW based on historical outage data from the past three fall seasons (starting with 2018). Due to a change in categorizing a type of outage called an Unavoidable Extension, unplanned outages (previously called forced outages) increased while planned outages (previously called maintenance outages) decreased by a like amount. This change resulted in greater unplanned outage amounts for the high and extreme unplanned outage cases. The Background tab now includes more outage accounting information as well as details regarding the change in categorizing Unavoidable Extension outages.

Starting with this SARA report, ERCOT expanded the low wind output scenario adjustment to include low solar output as well. Similar to the preliminary fall SARA report, the final fall SARA includes a tab that provides a set of extreme scenarios. These extreme scenarios assume that multiple severe system conditions occur simultaneously, resulting in very low probability, high impact system outcomes.

**Seasonal Assessment of Resource Adequacy for the ERCOT Region**  
**Fall 2021 - Final**  
**Release Date: September 3, 2021**

**Forecasted Capacity and Demand**

Resources, MW		
Operational Resources (thermal and hydro)	64,655	Based on current Seasonal Maximum Sustainable Limits reported through the unit registration process
Switchable Capacity Total	3,639	Installed capacity of units that can interconnect with other Regions and are available to ERCOT
Less Switchable Capacity Unavailable to ERCOT	-558	Based on survey responses of Switchable Resource owners
Available Mothballed Capacity	0	Based on seasonal Mothball units plus Probability of Return responses of Mothball Resource owners
Capacity from Private Use Networks	2,743	Average grid injection during the top 20 fall peak load hours over the last three years, plus the forecasted net change in generation capacity available to the ERCOT grid pursuant to Nodal Protocol Section 10.3.2.4.
Coastal Wind, Peak Average Capacity Contribution	1,472	Based on 35% of installed capacity for coastal wind resources (fall season) per ERCOT Nodal Protocols Section 3.2.6.2.2
Panhandle Wind, Peak Average Capacity Contribution	1,939	Based on 44% of installed capacity for panhandle wind resources (fall season) per ERCOT Nodal Protocols Section 3.2.6.2.2
Other Wind, Peak Average Capacity Contribution	6,906	Based on 37% of installed capacity for other wind resources (fall season) per ERCOT Nodal Protocols Section 3.2.6.2.2
Solar Utility-Scale, Peak Average Capacity Contribution	3,641	Based on 68% of rated capacity for solar resources (fall season) per Nodal Protocols Section 3.2.6.2.2
Storage, Peak Average Capacity Contribution	0	Based on 0% of rated capacity (fall season); resources assumed to provide Ancillary Services rather than sustained capacity available to meet peak loads
RMR Capacity to be under Contract	0	Based on the capacity of Resources providing Reliability Must Run (RMR) Service during the fall season
Capacity Pending Retirement	0	Announced retired capacity that is undergoing ERCOT grid reliability reviews pursuant to Nodal Protocol Section 3.14.1.2
Non-Synchronous Ties, Capacity Contribution	720	Based on import flows during most recent Energy Emergency Alert (EEA) intervals for the winter season (Used as a proxy for the fall season due to lack of EEA intervals.)
Planned Thermal Resources with Signed IA, Air Permits and Adequate Water Supplies	856	Based on in-service dates provided by developers
Planned Coastal Wind with Signed IA, Peak Average Capacity Contribution	256	Based on in-service dates provided by developers and 35% fall capacity contribution for coastal wind resources
Planned Panhandle Wind with Signed IA, Peak Average Capacity Contribution	0	Based on in-service dates provided by developers and 44% fall capacity contribution for panhandle wind resources
Planned Other Wind with Signed IA, Peak Average Capacity Contribution	1,713	Based on in-service dates provided by developers and 37% fall capacity contribution for other wind resources
Planned Solar Utility-Scale, Peak Average Capacity Contribution	2,451	Based on in-service dates provided by developers and 68% fall capacity contribution for solar resources
Planned Storage, Peak Average Capacity Contribution	0	Based on in-service dates provided by developers and 0% fall capacity contribution for storage resources
[a] Total Resources, MW		90,433
Peak Demand, MW	62,782	Based on average weather conditions at the time of the fall peak demand from 2005 – 2019, and updated based on a revised economic growth forecast prepared in April 2020
Rooftop PV Forecast, MW	120	Based on rooftop solar PV capacity during the peak load hour that is not already included in the peak load forecast
[b] Adjusted Peak Demand, MW		62,662
[c] Reserve Capacity [a - b], MW		27,771

### Reserve Capacity Risk Scenarios

	Expected Peak Load/ Expected Generation Outages/ Expected Renewable Output	Expected Peak Load/ High Generation Outages/ Expected Renewable Output	Expected Peak Load/ Expected Generation Outages/ Low Renewable Output	High Peak Load/ Expected Generation Outages/ Expected Renewable Output	
<b>Scenario Adjustments</b>					
Seasonal High Peak Load Adjustment	-	-	-	12,737	Based on the assumption that peak weather conditions from September 28, 2005, could occur in early October; the high fall forecast is 75,519 MW
Typical Planned Outages, Thermal	4,103	4,103	4,103	4,103	Based on historical average of Planned outages for October through November weekdays, hours ending 3 pm - 8 pm, for the last three years (2018 - 2020). Outage history excludes units that are not expected to be available for the peak period of the upcoming seasons. These unavailable units are comprised of units that have retired, have announced upcoming retirements, are under extended outage, are mothballed, or are unavailable switchable generators. <a href="#">See the Background tab for more information on thermal outage accounting practices.</a>
Typical Unplanned Outages, Thermal	10,671	10,671	10,671	10,671	Based on historical average of Unplanned outages for October through November weekdays, hours ending 3 pm - 8 pm, for the last three years (2018 - 2020). Outage history excludes units that are not expected to be available for the peak period of the upcoming seasons. These unavailable units are comprised of units that have retired, have announced upcoming retirements, are under extended outage, are mothballed, or are unavailable switchable generators.
High Unplanned Outage Adjustment, Thermal	-	4,965	-	-	Based on the 95th percentile of historical Unplanned outages for October through November weekdays, for the last three years (2018 - 2020); the adjustment is the 95th percentile value, 15,636 MW, less the typical Unplanned outage amount of 10,671 MW. Outage history excludes units that are not expected to be available for the peak period of the upcoming seasons. These unavailable units are comprised of units that have retired, have announced upcoming retirements, are under extended outage, are mothballed, or are unavailable switchable generators
Low Renewable Output Adjustment	-	-	13,685	-	Based on the 5th percentile of joint hourly wind and solar capacity factors (output as a percentage of installed capacity) associated with the 100 highest Net Load hours (Load minus wind output minus solar output) for the 2016-2020 fall Peak Load seasons; this low output level is 4,694 MW, and reflects a contribution of 3,033 MW from wind and 1,661 MW from solar.
[d] Total Uses of Reserve Capacity	14,774	19,739	28,459	27,511	

### Capacity Available For Operating Reserves

(n/a = not applicable for the risk scenario)

[e] Capacity Available for Operating Reserves, Normal Operating Conditions (c-d), MW Less than 2,300 MW indicates risk of EEA1	12,997	8,032	(687)	260	See the Background tab for additional details
[f] EEA Resources deployed by ERCOT	n/a	n/a	2,212	2,212	Consists of the sum of expected Load Resources Available for Responsive Reserves for the fall season (1,292 MW, which reflects a 2% gross-up to account for avoided transmission losses), Emergency Response Service (820 MW, which reflects a 2% gross-up to account for avoided transmission losses), and TDSP Voltage Reduction (100 MW). Other resources that may be available include voluntary customer Demand Response, switchable generation resources currently serving the Eastern Interconnection, and additional DC tie imports.
[g] Capacity Available for Operating Reserves, Emergency Conditions (e+f), MW Less than 1,000 MW indicates risk of EEA3 Load Shed	n/a	n/a	1,525	2,472	See the Background tab for additional details

**Seasonal Assessment of Resource Adequacy for the ERCOT Region**  
**Fall 2021 - Final**  
**Release Date: September 3, 2021**

**Extreme Reserve Capacity Risk Scenarios**

(Combinations of high and/or extreme risk assumptions resulting in low probability, high impact outcomes)

Scenario Adjustments	High Peak Load/ High Generation Outages/ Expected Renewable Output	High Peak Load/ High Generation Outages/ Low Renewable Output	High Peak Load/ Extreme Generation Outages/ Low Renewable Output	Description
Seasonal High Peak Load Adjustment based on 2005 Fall Weather	12,737	12,737	12,737	Based on the assumption that peak weather conditions from September 28, 2005, could occur in early October; the high fall forecast is 75,519 MW
Typical Planned Outages, Thermal	4,103	4,103	4,103	Based on historical average of Planned outages for October through November weekdays, hours ending 3 pm - 8 pm, for the last three years (2018 - 2020). Outage history excludes units that are not expected to be available for the peak period of the upcoming seasons. These unavailable units are comprised of units that have retired, have announced upcoming retirements, are under extended outage, are mothballed, or are unavailable switchable generators. <a href="#">See the Background tab for more information on thermal outage accounting practices.</a>
Typical Unplanned Outages, Thermal	10,671	10,671	10,671	Based on historical average of Unplanned outages for October through November weekdays, hours ending 3 pm - 8 pm, for the last three years (2018 - 2020). Outage history excludes units that are not expected to be available for the peak period of the upcoming seasons. These unavailable units are comprised of units that have retired, have announced upcoming retirements, are under extended outage, are mothballed, or are unavailable switchable generators. <a href="#">See the Background tab for more information on thermal outage accounting practices.</a>
High Unplanned Outage Adjustment, Thermal	4,965	4,965	4,965	Based on the 95th percentile of historical Unplanned outages for October through November weekdays, for the last three years (2018 - 2020); the adjustment is the 95th percentile value, 15,636 MW, less the typical Unplanned outage amount of 10,671 MW. Outage history excludes units that are not expected to be available for the peak period of the upcoming seasons. These unavailable units are comprised of units that have retired, have announced upcoming retirements, are under extended outage, are mothballed, or are unavailable switchable generators. <a href="#">See the Background tab for more information on thermal outage accounting practices.</a>
Low Renewable Output Adjustment	-	13,685	13,685	Based on the 5th percentile of joint hourly wind and solar capacity factors (output as a percentage of installed capacity) associated with the 100 highest Net Load hours (Load minus wind output minus solar output) for the 2016-2020 fall Peak Load seasons; this low output level is 4,694 MW, and reflects a contribution of 3,033 MW from wind and 1,661 MW from solar.
Extreme Unplanned Outage Adjustment, Thermal	-	-	1,460	Based on the highest hourly Unplanned Outage amount experienced during the fall seasons for 2011-2020 as a percentage of the aggregate fall capacity ratings for thermal resources. This percentage is 25.4%. The extreme Unplanned Outage amount is 17,096 MW, which is 25.4% times the net thermal capacity (the sum of capacities in rows 7 through 9 on the Scenarios tab minus Hydro resources). The adjustment is 17,096 MW less the sum of the typical plus high Unplanned Outage scenario amounts. <a href="#">See the Background tab for more information on thermal outage accounting practices.</a>
[d] Total Uses of Reserve Capacity	32,476	46,161	47,621	

**Capacity Available For Operating Reserves**

[e] Capacity Available for Operating Reserves, Normal Operating Conditions (Scenarios tab c-d), MW Less than 2,300 MW indicates risk of EEA1	(4,705)	(18,389)	(19,849)	See the Background tab for additional details
[f] EEA Resources deployed by ERCOT	2,212	2,212	2,212	Consists of the sum of expected Load Resources Available for Responsive Reserves for the fall season (1,292 MW, which reflects a 2% gross-up to account for avoided transmission losses), Emergency Response Service (820 MW, which reflects a 2% gross-up to account for avoided transmission losses), and TDSP Voltage Reduction (100 MW). Other resources that may be available include voluntary customer Demand Response, switchable generation resources currently serving the Eastern Interconnection, and additional DC tie imports.
[g] Capacity Available for Operating Reserves, Emergency Conditions (e+f), MW Less than 1,000 MW indicates risk of EEA3 Load Shed	(2,493)	(16,177)	(17,637)	See the Background tab for additional details

Notes:

Capacity changes due to planned repower/upgrade projects are reflected in the operational units' ratings upon receipt and ERCOT approval of updated resource registration system information. Interconnection requests for existing resources that involve MW capacity changes are indicated with a code in the "Generation Interconnection Project Code" column.

Although seasonal capacity ratings for battery energy storage systems are reported above, the ratings are not included in the operational/planned capacity formulae. These resources are assumed to provide Ancillary Services rather than sustained capacity available to meet system peak loads.

Unit Names with a (DGR) suffix are Distribution Generation Resources. Units rated 10 MW or less currently do not go through the GINR application process.

The capacities of planned projects that have been approved for Initial Synchronization at the time of report creation are assumed to be available for the season regardless of their projected Commercial Operations Dates.

Planned projects for which maximum seasonal sustained capacity ratings have been provided are used in lieu of capacities entered into the online Resource Integration and Ongoing Operations - Interconnection Services (RIOO-IS) system.

\* TOPAZ POWER PLANT, 20INR0231: Seven of the ten gas turbine units that make up this plant were approved for commercial operations on 8/26/21.

## Seasonal Assessment of Resource Adequacy for the ERCOT Region

### Background

The Seasonal Assessment of Resource Adequacy (SARA) report is a deterministic approach to considering the impact of potential variables that may affect the sufficiency of installed resources to meet the peak electrical demand on the ERCOT System during a particular season.

The standard approach to assessing resource adequacy for one or more years into the future is to account for projected load and resources on a normalized basis and to require sufficient reserves (resources in excess of peak demand, on this normalized basis) to cover the uncertainty in peak demand and resource availability to meet a probabilistic reliability standard.

For seasonal assessments that look ahead less than a year, specific information may be available (such as seasonal climate forecasts or anticipated common-mode events such as a system-wide heat wave) which can be used to consider the range of resource adequacy in a more deterministic manner.

The SARA report focuses on the availability of sufficient operating reserves to avoid emergency actions such as deployment of voluntary load reduction resources. It uses an operating reserve thresholds of 2,300 and 1,000 MW to indicate the risk that an Energy Emergency Alert Level 1 (EEA1) and Level 3 (EEA3) may be triggered during the time of the forecasted seasonal peak load. These threshold levels are intended to be roughly analogous to the 2,300 and 1,000 MW Physical Responsive Capability (PRC) thresholds for EEA1 and EEA3 with Load Shed, respectively. However, PRC is a real-time capability measure for Resources that can quickly respond to system disturbances. In contrast, the SARA operating reserve reflects additional capability assumed to be available before energy emergency procedures are initiated, such as from Resources qualified to provide non-spinning reserves. Additionally, the amount of operating reserves available may increase relative to what is included in the SARA report due to the market responding to wholesale market price increases and anticipated capacity scarcity conditions. Given these considerations, ERCOT believes that the 2,300 and 1,000 MW reserve capacity thresholds are reasonable indicators for the risk of Energy Emergency Alerts given the uncertainties in predicting system conditions months in advance.

The SARA report is intended to illustrate the range of resource adequacy outcomes that might occur. It serves as a situational awareness tool for ERCOT operational planning purposes, and helps fulfill the "extreme weather" resource adequacy assessment requirement per Public Utility Commission of Texas rule 25.362(i)(2)(H). In addition to a base scenario, several other scenarios are developed by varying the value of load forecast and resource availability parameters. The variation in these parameters is based on historic ranges of the parameter values or known changes expected in the near-term.

### Thermal Outage Accounting

Directly comparing SARA thermal unplanned (previously "forced") outage scenario capacity with outage amounts listed in ERCOT outage reports — such as the Unplanned Resource Outages Report — will yield misleading results. The reason is that the SARA report consists of multiple resource availability line items, and thermal outages for certain resource types are reflected elsewhere in the SARA reports rather than the thermal outage scenario line items. As a result, the SARA thermal outage scenario amounts will always be less than what is typically shown in other outage reports. The main differences include the following:

- Outages for Private Use Network (PUN) generators are incorporated in the line item called "Capacity from Private Use Networks." This is an aggregate estimate of the amount of energy injected into the ERCOT grid during the highest 20 seasonal hourly demands for the last three years, and incorporates average generator outage amounts over those hourly intervals as well as reflects PUN owner decisions to supply power to their industrial loads versus export to the grid. PUN outages are thus already reflected in the SARA available resource capacity estimate.
- Extended outages are reported in the SARA Capacities tab in a line item called "Operational Capacity Unavailable due to Extended Outage or Derate." Extended Outages are those forced outages that are expected to last a minimum of 180 days as reported by the resource owner via submission of a Notice of Suspension of Operations (NSO) form. These outages are thus already reflected in the SARA available resource capacity estimate.
- The capacity of Switchable Generation Resources (SWGRs) that are assumed to serve a neighboring grid for the season is deducted from available resource capacity, so outages associated with these SWGRs are not reflected anywhere in the SARA report.

To more closely align the SARA with other outage reports based on ERCOT Outage Scheduler data, a modification was made to the treatment of outages classified as *Unavoidable Extensions*, or UEs. UEs are defined as "a Planned or Maintenance Outage that is not completed within the ERCOT-approved timeframe and extended." For past SARA reports, if the original outage was classified as Planned in the Outage Scheduler, then the UE would continue to be classified as Planned. If the original outage was classified as Forced, then the UE would continue to be classified as Forced. In contrast, for other ERCOT outage reports, UE outages are all classified as Forced (Unplanned). SARA reports now treat all UEs as Unplanned. While this category change does not impact the total base outage amount, it does increase the high and extreme unplanned thermal adjustments used in several risk scenarios.
