

# **Monthly Outlook for Resource Adequacy (MORA)**

## **Reporting Month: June 2024**

**Report Date: April 5, 2024**

### **Disclaimer**

This ERCOT report has been developed from data provided by ERCOT Market Participants, ERCOT, and ERCOT's consultants. The data may contain errors or become obsolete shortly after the report is released. ERCOT MAKES NO WARRANTY, EXPRESS OR IMPLIED, INCLUDING ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE, AND DISCLAIMS ANY AND ALL LIABILITY WITH RESPECT TO THE ACCURACY OF SAME OR THE FITNESS OR APPROPRIATENESS OF SAME FOR ANY PARTICULAR USE. THIS ERCOT REPORT IS SUPPLIED WITH ALL FAULTS. The specific suitability for any use of this report and its accuracy should be confirmed by each ERCOT Market Participant that contributed data for this report.

Note that resource data is based on a mid-month Resource Integration and Ongoing Operations (RIOO) system snapshot. Resource quantities can differ from monthly reports prepared subsequent to the MORA report, such as the Generator Interconnection Status (GIS) report, which is released at the beginning of the subsequent month.

### **MORA Release Schedule**

**MORA releases are targeted for the first Friday of each month.** A MORA is released two months prior to the reporting month; for example, the planned release of the MORA report for August would be the first Friday in June.

ERCOT may post one or more revised versions of a MORA report if material data errors are discovered. ERCOT recommends that readers check for postings of a revised report around mid-month. Information about one or more data corrections for a revised report will be summarized in the box below.

#### **Data Corrections**

### **Report Contents**

Tab Name	Description
Monthly Outlook	<u>Contains the following sections</u> Introduction Risk Outlook Highlights and Resource Adequacy Measures Hourly Risk Assessment of Capacity Available for Operating Reserves Deterministic Scenarios Notable Resource Developments
Capacity by Resource Category	Summary table of generation resources by resource category
Resource Details	List of registered resources and megawatt (MW) capabilities for the reporting month
PRRM Percentile Results	Probabilistic model results: deciles for (1) hourly gross demand, (2) hourly solar and wind generation, and (3) daily unplanned thermal unit outages
Background	Covers certain MORA methodology topics in detail

## INTRODUCTION

The MORA report adopts two approaches to evaluate resource adequacy for the upcoming assessment month:

- Determine the risk that ERCOT may face emergency conditions for the monthly peak load day — specifically, the chances, during a range of hours, that it June need to issue an Energy Emergency Alert (EEA) or begin to order controlled outages to maintain grid reliability. This evaluation is done through probabilistic modeling using ERCOT's Probabilistic Reserve Risk Model, PRRM. (See the Background tab for more information.)
- Given a predetermined set of future grid conditions (deterministic scenarios), evaluate the extent that resource capacity can provide sufficient operating reserves for the hour with the highest risk of a reserve shortage. The focus of the MORA's deterministic scenarios is on typical grid conditions as well as the dominant reserve risk factor for the given month typically winter storm events and low wind output for other months.

Deterministic scenarios allow one to gauge how individual grid conditions influence a range of fixed outcomes while probabilistic simulation quantifies the uncertainty around the outcomes and produces likelihood estimates for them. These approaches complement each other to provide a richer perspective on reserve shortage risks for the ERCOT region.

### Risk Outlook Highlights and Resource Adequacy Measures

- Probabilistic modeling results indicate a low risk of ERCOT having to declare an EEA, with hourly probabilities for EEA declaration of under one percent. Reserve shortage risks are the highest during the early evening hours—Hour Ending 8 p.m. and 9 p.m., Central Daylight Savings Time (CDT)—when daily loads are typically near their highest levels and solar production is ramping down. The highest risk hour is Hour Ending 9 p.m.
- Under typical grid conditions, the deterministic scenario indicates that there should be sufficient generating capacity available for the hour with the highest reserve shortage risk, Hour Ending 9 p.m., Central Daylight Time. (The forecasted peak demand hour is 5 p.m.)
- The possibility of low wind production remains a significant risk for maintaining adequate reserves for the peak demand day. Probabilistic and deterministic scenarios that reflect an historically low June wind generation day (based on weather going back to 1980) indicates an increased reserve shortage risk during the early evening hours.
- The monthly capacity reserve margin, expressed as a percentage, is 48.5% for the highest-risk load hour, Hour Ending 9 p.m.  
(Reserve Margin formula: ((Total Resources / (Peak Demand - Emergency Resources)) - 1) \* 100)
- The ratio of installed dispatchable to total capacity is 60%. The ratio of available dispatchable to available total capacity for the peak risk hour (9 p.m.) is 79%. This latter measure helps indicate the extent that the grid relies on dispatchable resources to meet the load for the highest risk hour.

### Hourly Risk Assessment of Capacity Available for Operating Reserves (CAFOR)

The tables below provide hour-by-hour probabilities that Capacity Available for Operating Reserves (CAFOR) will be at a level indicative of (1) normal system conditions, (2) the risk of an Energy Emergency Alert (EEA), and (3) the risk that ERCOT may need to order controlled outages. As a guideline to interpret these probabilities, ERCOT considers an EEA probability below 10% to indicate that the reserve adequacy risk is low for the monthly peak load day. Note that this probability forecast is not intended to predict specific capacity reserve outcomes. The CAFOR definition is provided at the top of the Background tab.

The table at right represents an extreme low wind generation scenario for which wind probability distributions are replaced with fixed generation values from hourly synthetic wind generation profiles for the wind fleet expected in June. The synthetic wind generation profiles (aggregated for all wind units) reflect hourly weather conditions for each historical year for 1980 through 2022. The 24 hourly wind profile values are from the historical June day, June 12, 1986, for which wind generation was approximately at the first percentile level for Hour Ending 9 p.m. (3,570 MW). Hour Ending 9 p.m. was determined to be the highest-risk hour for reserve shortages based on the probabilistic modeling results. The scenario simulation results indicate that fixing wind output based on 6/12/1986 weather conditions increases reserve shortage risk for Hours Ending 8 and 9 p.m.

Note that the May MORA assumed a 5th percentile fixed value. Using the 5th percentile wind generation for the highest-risk hour (5,945 MW) in June results in a slight decrease in EEA risk. Fixing wind to 5,945 MW eliminates CAFOR outcomes where wind generation is lower than this amount. Those CAFOR outcomes with extremely low wind generation produce most of the EEA events. The result is that while average CAFOR is lower across all the 10,000 simulation outcomes, the frequency of CAFOR below the EEA risk threshold is reduced relative to the case where wind generation is not fixed to the 5th percentile value.

Hour Ending (CDT)	EMERGENCY LEVEL			Scenario Assuming Extreme Low Wind Generation		
	Chance of Normal System Conditions	Chance of an Energy Emergency Alert	Chance of Ordering Controlled Outages	Hour Ending (CDT)	Chance of Normal System Conditions	Chance of an Energy Emergency Alert

Note: Probabilities are not additive.

**June Deterministic Scenarios:**  
**(1) The hour with the highest risk of reserve shortages (Hour Ending 9 p.m.)**  
**(2) The same hour assuming low wind generation**

**Scenario Selection**

For June, both scenarios focus on hour-ending 9 p.m. as it is the hour expected to have the highest reserve shortage risk based on Probabilistic Reserve Risk Model (PRRM) results as shown above.

Since wind intermittency is the most impactful reserve risk factor for June, ERCOT chose to include a low wind generation scenario.

Loads and Resources (MW)	Hour with the Highest Reserve Shortage Risk (Hour Ending 9 p.m., CDT)	Extreme low Wind Generation Scenario (Hour Ending 9 p.m., CDT)
<b>Load Based on Average Weather [1]</b>	<b>66,230</b>	<b>66,230</b>
Large Load Adjustment [2]	580	580
<b>Total Load</b>	<b>66,810</b>	<b>66,810</b>
<b>Generation Resource Stack</b>		
Dispatchable [3]	74,560	74,560
Thermal	71,791	71,791
Energy Storage [4]	2,322	2,322
Hydro	447	447
Expected Thermal Outages	6,393	6,346
Planned	174	169
Unplanned	6,219	6,177
Total Available Dispatchable	<b>68,167</b>	<b>68,214</b>
Non-Dispatchable [5]		
Wind	17,987	3,750
Solar	514	514
Total Available Non-Dispatchable	<b>18,501</b>	<b>4,264</b>
Non-Synchronous Ties, Net Imports	817	817
<b>Total Available Resources (Normal Conditions)</b>	<b>87,486</b>	<b>73,296</b>

  

Emergency Resources		
Available prior to an Energy Emergency Alert		
Emergency Response Service	1,023	1,023
Distribution Voltage Reduction	573	573
Large Load Curtailment	580	580
<b>Total Available prior to an Energy Emergency Alert</b>	<b>2,175</b>	<b>2,175</b>
Available during an Energy Emergency Alert		
LRs providing Responsive Reserves	1,137	1,137
LRs providing Non-spin	20	20
LRs providing ECRS	245	245
<b>Total Available during an Energy Emergency Alert</b>	<b>1,402</b>	<b>1,402</b>
<b>Total Emergency Resources</b>	<b>3,577</b>	<b>3,577</b>

  

Capacity Available for Operating Reserves, Normal Conditions	22,851	8,661
Capacity Available for Operating Reserves, Emergency Conditions	24,253	10,063

Less than 2,500 MW indicates risk of EEA Level 1

Less than 1,500 MW indicates risk of EEA Level 3 Load Shed

[1] The 9 p.m. load value come from ERCOT's monthly load forecast. The typical peak load assumes average June weather conditions.

[2] See the bottom of the Background tab for information on forecasting crypto-mining electricity consumption and the Large Load adjustment.

[3] Dispatchable resources comprise nuclear, coal, gas, biomass and energy storage. Non-dispatchable resources comprise wind and solar. Dispatchable in this context means that the resource can both increase or decrease output based on ERCOT dispatch instructions.

[4] Battery storage available capacity is based on each hour's State of Charge (SOC) capacity factor, which is the hourly average aggregate State of Charge divided by installed capacity for the month. The capacity factor is 36% for the June highest reserve risk hour, Hour Ending 9 p.m.

[5] Wind and solar values for 9 p.m. represent the 50th percentile values from hourly synthetic output profiles used in the PRRM. See the Background tab for more information.

**Notable Resource Adequacy Developments**

A new gas-fired plant (484 MW installed capacity) is currently expected to be available for June 2024. This plant would be the largest gas resource addition since the start of MORA releases in November 2023.

Due to transmission constraints in South Texas that impact the export and import of power transfers into the San Antonio region, the risk of EEA events (including load shed) may be somewhat higher than quoted if the constraints limit the ability of all generation to be used to serve system demand. ERCOT is working to reflect the probabilistic risk impact of these constraints into future MORA reports. This risk is anticipated to remain until at least the completion of the San Antonio South Reliability Project anticipated for Summer 2027.

NOTES:

[1] Operational resources are those for which ERCOT has approved grid synchronization or full commercial operations. Unit level details for each resource category can be found in the Resource Details tab.

[2] Installed capacity ratings are based on the maximum power that a generating unit can produce during normal sustained operating conditions as specified by the equipment manufacturer. All gas-fired Private-Use Network (PUNs) units are reflected in the combined cycle fuel type row above.

[3] *Expected Available Capacity* for operational units accounts for thermal seasonal sustained capability ratings, hourly capacity contribution estimates for intermittent renewables, planned retirements, reductions due to co-located loads, unavailable Switchable Generation Resources (SWGRs), mothballed capacity, and expected Private Use Network (PUN) generator net exports to the grid. For planned projects, Expected Available Capacity is based on the maximum capacity reported by the developers and accounts for net changes due to repower or upgrade projects greater than one MW, and the established limits on the total MW Injection for designated Self-Limiting Facilities. Unit level details for each resource group above can be found in the Resource Details tab.

[4] Includes a small amount of hydro units that are considered intermittent resources (run-of-river DG hydro units).

[5] Planned resources are those for which ERCOT expects to be approved for grid synchronization or has been assigned a "Model Ready Date" (for Small Generators) by the first of the month.

## **Background**

### **Capacity Available for Operating Reserves (CAFOR)**

CAFOR Formula:

- = Monthly Maximum Expected Resource Generation Capability
  - Demand
  - Thermal Outages
  - + Pre-EEA Resources if CAFOR < 3,000 MW
  - + EEA Resources if CAFOR < 2,500 MW

Note that winter storm scenarios also account for incremental unplanned wind outages due to severe storm events. The synthetic wind profiles used in the Probabilistic Reserve Risk Model (PRRM) account for normal availability.

The MORA uses CAFOR reserve thresholds of 2,500 and 1,500 MW to indicate, respectively, the risk that an Energy Emergency Alert and controlled outages may be triggered during the time of the forecasted monthly peak load day. These threshold levels are intended to be proxies to the 2,500 and 1,500 MW Physical Responsive Capability (PRC) thresholds. While PRC is a real-time capability measure for Resources that can quickly respond to system disturbance, ERCOT believes that the 2,500 and 1,500 MW CAFOR thresholds are appropriate indicators for the risk of Emergency Conditions given the uncertainties in predicting system conditions months in advance.

### **Wind and Solar Capacity Values**

Hourly capacity contributions for specific Wind and solar capacity values come from hourly synthetic generation profiles prepared for existing sites and planned sites expected to generate power by the beginning of the month. Every site has multiple profiles representing hourly generation for each historical weather year going back to 1980. The profiles are used to develop hourly probability distributions for the Probabilistic Reserve Risk Model.

### **Probabilistic Modeling**

For MORA development, ERCOT uses an in-house-developed model called the Probabilistic Reserve Risk Model (PRRM). The model uses Monte Carlo simulation techniques to generate 10,000 outcomes for Capacity Available for Operating Reserves (CAFOR). The model incorporates hourly risk variables, which are the load and resource-specific capacity amounts expressed as hourly or daily probability distributions based on historical data and forecast assumptions.

The risk variables comprise the following:

- *Monthly Peak Load* - The Peak load variable is negatively correlated with a system-average temperature probability distribution. (For the winter months, the lower the temperature selected by the model for a simulation, the higher the peak load selected.) The model also uses multiple normalized hourly load shapes to simulate loads for the hourly range; load shapes reflect actual hourly loads for historical monthly peak load days.
- *Wind Production* - Hourly probability distributions are fitted to hourly synthetic production profiles. Profiles are developed for each operational and planned wind site with wind output values aggregated to system values. The profiles reflect weather-year variability back to 1980. Temporal correlations between hourly probability distributions are applied to simulate hourly wind speed persistence effects.
- *Solar Production* - Hourly probability distributions are fitted to hourly synthetic production profiles just like wind. Temporal correlations between hourly probability distributions are applied to simulate hourly solar irradiance persistence effects.
- *Low Ambient Temperature Curve* - A range of hourly average Texas-wide low temperatures (for the winter months). The low temperature probability distribution is correlated with both the peak load and cold-weather-related thermal outage probability distributions.
- *Typical Unplanned Thermal Outages based on Normal Weather* - A range of daily unplanned outage amounts based on assessment month history for the past three years. For the winter months, outages during major winter storms are excluded from the probability distributions.
- *Extreme-Weather-Related Thermal Outages* - For the winter months, the probability distribution reflects a range of daily unplanned weather-related outage amounts scaled from zero MW to the maximum amount observed during Winter Storm Uri. The probability distribution is correlated with the Low Ambient Temperature curve.
- *Switchable Generation Resources Currently Serving Neighboring Grids* - The model includes individual probability distributions for each SWGR currently serving customers in the Southwest Power Pool that are able to switch to ERCOT if allowed based on prevailing power supply contracts. Such SWGRs are designated as the "Controlling Party" in the most current ERCOT-SPP Coordination Plan. (The Plan is consistent with the "Notices of Unavailable Capacity for Switchable Generation Resources" provided to ERCOT.) The probability distributions are binary—each unit is made available or not, with the probability of being available based on analysis of Current Operating Plan (COP) data covering Winter Storm Elliott and the EEA event on September 6, 2023. This variable is treated an available Pre-EEA resource in the model, and assumes that this SWGR capacity may be available if requested by ERCOT to address an Energy Emergency.
- *Remaining Non-Synchronous Tie Transfers* - The model uses the DC Tie capacity contribution amounts cited in recent Capacity, Demand and Reserves (CDR) reports as the base amounts. A probability distribution represents the remaining transfer capability that may be available during an ERCOT Energy Emergency. This variable is treated as an available Pre-EEA resource in the model.

- *Weather-related Outage Reduction Success Rate due to Weatherization* - The model uses a triangular probability distribution to reflect a percentage range of outage reduction amounts, currently set to a likeliest value of 85% and minimum and maximum values of 80% and 90%, respectively. The probability distribution will be modified as actual success rate data is accumulated over time.

The model also includes several resource variables that are not associated with probability distributions, but are dynamic in that their capacity values are dependent on other variable values calculated by the model. These include the following:

- *Battery Energy Storage Capacity Contribution* - ERCOT calculates the battery storage capacity contribution based on an analysis of SCADA High Sustained Limit (HSL) and State of Charge (SOC) data. Values for all hours are based on SOCs observed for representative days in the given month, and are expressed as capacity factors using the expected installed capacity for the start of the month. For winter MORA reports, which account for severe winter storm conditions, the values are based on SOCs observed during Winter Storm Elliott (December 22-23, 2022).
- *Incremental Demand Response* - The ERCOT load forecast model accounts for historical demand response impacts. An amount reflecting additional response during high load conditions is selected by the model. Once the hourly loads exceed a given high percentile value, the model selects a fixed amount. The amounts are based on analysis conducted by ERCOT's Market Analysis & Validation Department staff.
- *Private Use Network (PUN) Generator Net Imports* - PUN generator imports come from historical High Sustained Limit data for the assessment months from the last three years. For winter months, the model will also add an incremental amount of PUN generator capacity when the model selects an extremely low temperature, indicative of system stress conditions and opportunities for the PUN owners to take advantage of high market prices.

#### **Estimating Peak Electricity Consumption for Operational Large Loads**

Due to a new influx of Large Loads, an interim solution was implemented to better account for the peak consumption of these loads during non-summer months. The new interim methodology utilizes the seven hours over each month for each of the past three years with the lowest average Physical Responsive Capability and compares historical load zone prices to an ERCOT determined (and industry backed) estimate of the bitcoin mining breakeven cost. This breakeven cost is estimated by using the average specifications of an Antminer S19 bitcoin mining rig and a future hashprice as indicated by Luxor's Hashrate Forward Curve for the forecast month. If the historical load zone price for the Large Load's respective load zone was below the breakeven threshold, then the Large Load's peak consumption for the hour was estimated to be the maximum observed consumption at the site according to internal tracking of Large Load projects. If the historical load zone price was greater than the breakeven threshold, then the Large Load was assumed to be fully curtailed and consuming only 3% of the Large Load's maximum capability. The 3% assumption accounts for the idle power draw of ASIC miners and necessary auxiliary cooling on site. The estimated consumption for each Large Load, including both co-located and stand-alone loads, was summed for each of the 21 hours analyzed and then averaged to calculate the total estimated average consumption.

Note that roughly every four years the Bitcoin industry undergoes a halving of the reward for mining Bitcoins, with the latest expected for late April 2024. Each halving event for the "mining block reward" reduces the amount of new Bitcoin supplies. While a halving event can increase Bitcoin prices in the near term, the overall impact is to reduce mining revenues and incentivize miners to reduce electricity consumption during times of high prices. Price-responsive Bitcoin miners, exposed to the real-time price of electricity, are anticipated to curtail more frequently and at lower breakeven costs following the halving event. Consequently, a significantly smaller amount of operational large flexible load is expected to be consuming electricity during reserve "at risk" hours on average.

#### **Large Load Adjustment for the Load Forecast**

The original load forecast used for the MORA reports includes an estimate of Large Load electricity consumption. This Large Load estimate excludes the impact of expected future price responsive behavior except for the summer months when Large Loads take advantage of "4 Coincident Peak" (4CP) demand charge savings programs. To provide a timely Large Load consumption forecast estimate that accounts for price responsive behavior during all forecast months, ERCOT's Large Load Integration Department prepares a Large Load consumption adjustment for the MORA reports. This adjustment replaces the original Large Load consumption estimate that accompanies the monthly load forecast.
