Report on the Capacity, Demand and Reserves (CDR) in the ERCOT Region, 2026-2030

May 16, 2025

ERCOT PUBLIC

Table of Contents

Tab	Notes
Disclaimer	Please read

MAIN REPORT

Findings & Discussion	Overview and highlights of the CDR
Load-Resource Scenarios	Presents condensed demand-resource summaries for the summer and winter seasons based on alternative peak demand and/or resource scenarios
Seasonal Summary	Shows load forecasts, resource capacities and reserve margins for the next five summer, winter, spring, fall seasons, for both the expected Peak Load hour and Peak Net Load Hour

DATA TABLES

Unit Details	List of registered resources and capabilities used in determining the capacity contributions by Season
Capacity by Resource Type	A table that lists installed capacities by fuel/technology type categories
ELCCs	Background on Effective Load Carrying Capabilities (ELCCs) for Inverter Based Resources, along with table that lists the ELCC values used for Planning Reserve Margin calculation
New CDR-Eligible Resources	A table listing those planned resources that have meet the criteria to be included in the CDR since the last CDR release

DOCUMENTATION

Acronyms	List of acronyms used in the CDR data tables
Definitions	Definitions of terms used in the CDR
Wind-Solar Region Mapping	Tables that list the counties in the ERCOT region assigned to the CDR Wind and Solar Regions
Background	An overview of the CDR's purpose and key concepts needed to interpret results

Disclaimer

FOR PLANNING PURPOSES ONLY

This CDR report has been prepared using data provided by ERCOT and Market Participants. The data may contain errors or become obsolete and thereby affect the accuracy of report results. ERCOT MAKES NO WARRANTY, EXPRESS OR IMPLIED, INCLUDING ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE, AND DISCLAIMS ANY AND ALL LIABILITY WITH RESPECT TO THE ACCURACY OF SAME OR THE FITNESS OR APPROPRIATENESS OF SAME FOR ANY PARTICULAR USE. THIS ERCOT REPORT IS SUPPLIED WITH ALL FAULTS. The specific suitability for any use of the CDR report and its accuracy should be confirmed by each ERCOT Market Participant that contributed data.

CDR - Findings & Discussion

Overview

- This CDR reflects a late April 2025 snapshot of expected resources and loads based on prescriptive rules (ERCOT Protocols), load forecasting methodologies, and information from resource developers/owners and transmission companies. The CDR provides a deterministic view of future resource adequacy along with several alternative load and planned resource scenarios designed to capture a range of potential reserve margin outcomes. Since the CDR is based on forecasted information as of a certain point in time, state/federal policy changes, economic developments, market design initiatives, evolving grid management practices, and technology improvements, can significantly alter the long-term resource adequacy outcome as reflected in this CDR. Nevertheless, the CDR signals an indicative trend of eroding resource adequacy (planning reserve margins) in the absence of major mitigating factors.

  A description of the most significant load and resource uncertainties and how they are addressed through alternative deterministic scenarios is provided in the Load/Resource Forecast Uncertainty section below.

- One scenario in this CDR—using "Protocol Prescribed" capacity resources and the new *ERCOT Adjusted Load Forecast*—indicates that summer Planning Reserve Margins for 2026 through 2030 decrease significantly from year to year, and cross over to negative values in 2028. (In contrast, for the last CDR released in February 2025, the crossover occurred in 2026/2027. The improved reserve margin outlook is mainly due to the updated load forecast described below.) The summer Margins for the peak Net Load hours are lower than for the peak Load hours due mainly to decreasing solar generation availability in the early evening when loads are still high.

CDR Methodology Changes

- This CDR incorporates spring and fall season data for the first time. To better accommodate the expanded seasonal reporting, the separate Summary tabs are consolidated into a single "Seasonal Summary" tab. The summer and winter season data columns are reported first (left to right) since they represent the highest-risk seasons in terms of insufficient capacity reserves.
- To reflect the impact of planned fuel conversion projects for which a public announcement has been made, or the project is in the interconnection study queue but doesn't meet the planned project eligibility criteria for inclusion in the CDR, a new status designation, OPER-UNFC (unconfirmed planned fuel conversion for an operating unit), has been created. The original unit line item plus a new line item with OPER-UNFC represents the before-and-after unit differences, respectively. This change addresses two announced coal-to-gas conversion projects: Coleto Creek (655 MW seasonal rating) and J.K. Spruce 2 (785 MW seasonal rating). These units were previously treated as Unconfirmed Retirements without factoring in the fuel conversion impact.

  Details on the fuel conversion accounting methodology are provided here: Background tab

CDR Load Forecast

- This CDR is based on the new ERCOT Adjusted Forecast prepared in March-April 2025. The load forecast data and associated forecast methodology document are available here:

  https://www.ercot.com/files/docs/2025/04/08/ErcotAdjustedForecast.xlsb

  https://www.ercot.com/files/docs/2025/04/08/2025-LTLF-Report.pdf

- The hourly load forecast values in this CDR, based on the ERCOT Adjusted Forecast, comprise the sum of the forecast components in the following two formulas:

  Base Forecast = Base Economic Forecast + Electric Vehicle Forecast + Large Flexible Load Forecast – Rooftop Solar Forecast

  ERCOT Adjusted Forecast = Base Forecast + ERCOT Adjustments to Transmission Service Provider (TSP) forecasts

- The ERCOT adjustments to TSP-provided forecasts comprise the following:

  – 180-Day Delay for Contracts and Officer Letter Load: ERCOT applies a 180-day delay to all contract and officer letter load forecasts provided by TSPs.

  – All new data center load requests are reduced to 49.8% of the original request.

  – All Officer Letter Load requests are reduced to 55.4% of the original request.

- ERCOT assumes all Loads other than Large Flexible Loads (i.e., crypto-currency mining) are considered Firm Loads. Firm Loads are Loads that will remain on when entering emergency conditions. On the other hand, Large Flexible Loads are responsive to real time prices and can reduce consumption or turn off quickly before emergency conditions. With an expectation of increasing Large Loads (75 MW or more) like data centers connecting to the ERCOT grid, there continues to be discussion among policymakers and the industry regarding requirements for Large Loads to be demand-flexible during periods of grid scarcity. For this CDR, no assumptions concerning potential flexibility requirements for data centers have been incorporated.

- The following table shows the amount of new planned loads, by type, included in the ERCOT Adjusted Forecast update for summer 2026-2030. The last column indicates the average annual growth rate.

	New TSP-Reported Loads Added to the April 2025 ERCOT Adjusted Load Forecast Cumulative MW					
Large Load Type	**Summer 2026**	**Summer 2027**	**Summer 2028**	**Summer 2029**	**Summer 2030**	**Avg. Annual Growth Rate (%)**
Contracted Loads*	4,894	8,654	15,336	17,130	19,560	41%
TSP Officer Letter Loads**	2,733	7,420	16,792	21,233	28,223	79%
Total	7,627	16,074	32,128	38,362	47,783	58%

* Contracted Loads: All planned loads with signed interconnection agreements reported to ERCOT by the loads' Transmission Service Providers

** All planned loads documented in a TSP officer letter. (An officer letter is an attestation indicating confidence that loads are expected to be interconnected even though the interconnection agreement has not been signed yet.)

- The following table shows the summer peak Load and peak Net Load forecasts for 2026-2030, along with the associated peak load hours:

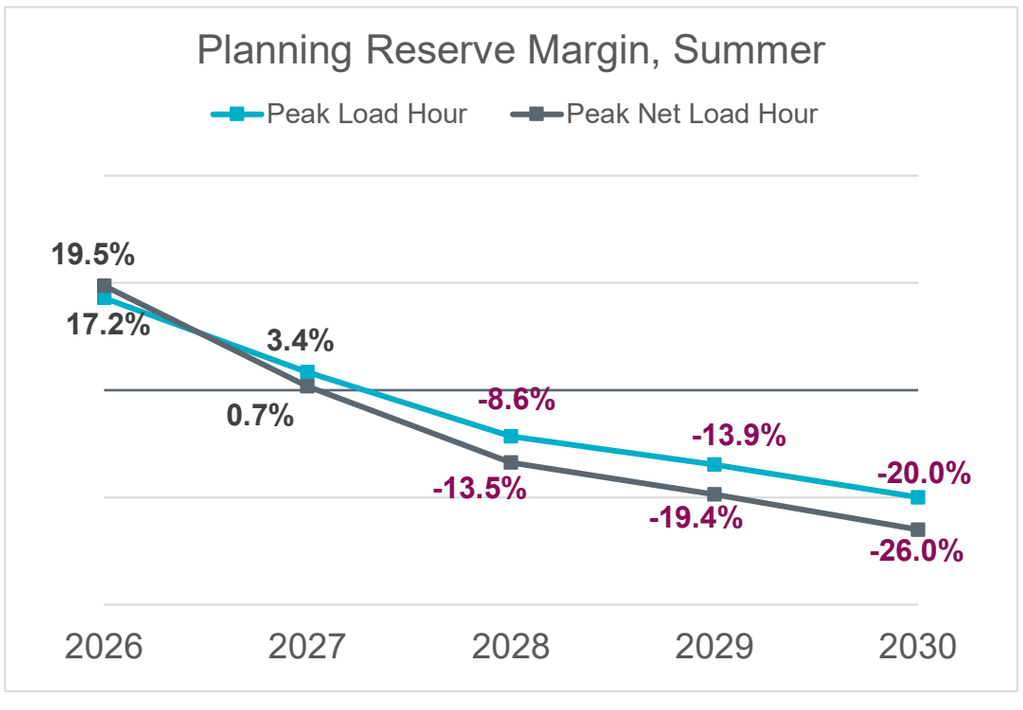
	Load for the peak Load hour		Load for the peak Net Load hour (Load minus wind and solar generation)	
Year	**Base Summer Forecast**	**Summer Peak Load Hour (Hour Ending)**	**Base Summer Forecast**	**Summer Peak Net Load Hour (Hour Ending)**
2026	94,159	5:00 p.m.	81,411	9:00 p.m.
2027	103,725	5:00 p.m.	91,088	9:00 p.m.
2028	120,875	5:00 p.m.	108,314	9:00 p.m.
2029	127,905	5:00 p.m.	115,532	9:00 p.m.
2030	138,010	5:00 p.m.	126,198	9:00 p.m.

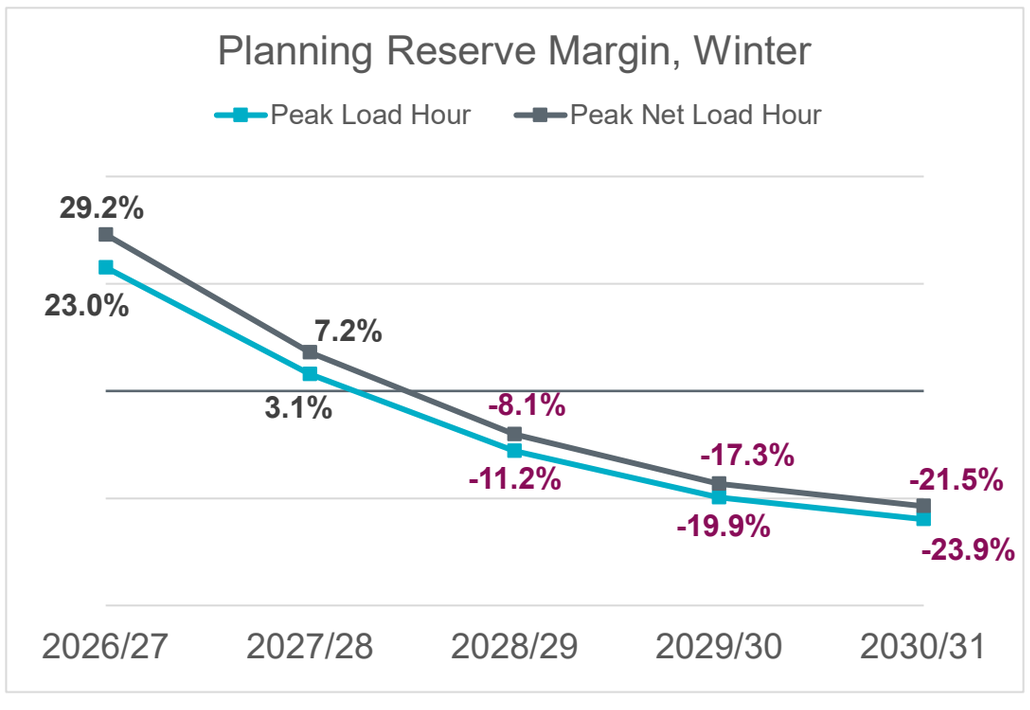
Planning Reserve Margins for the Peak Load and Peak Net Load Hours

- The following charts show the summer and winter Planning Reserve Margin trends for the scenario based on the ERCOT Adjusted Load Forecast and Protocol-prescribed resource capacity. Trends are shown for the peak Load and peak Net Load hours.

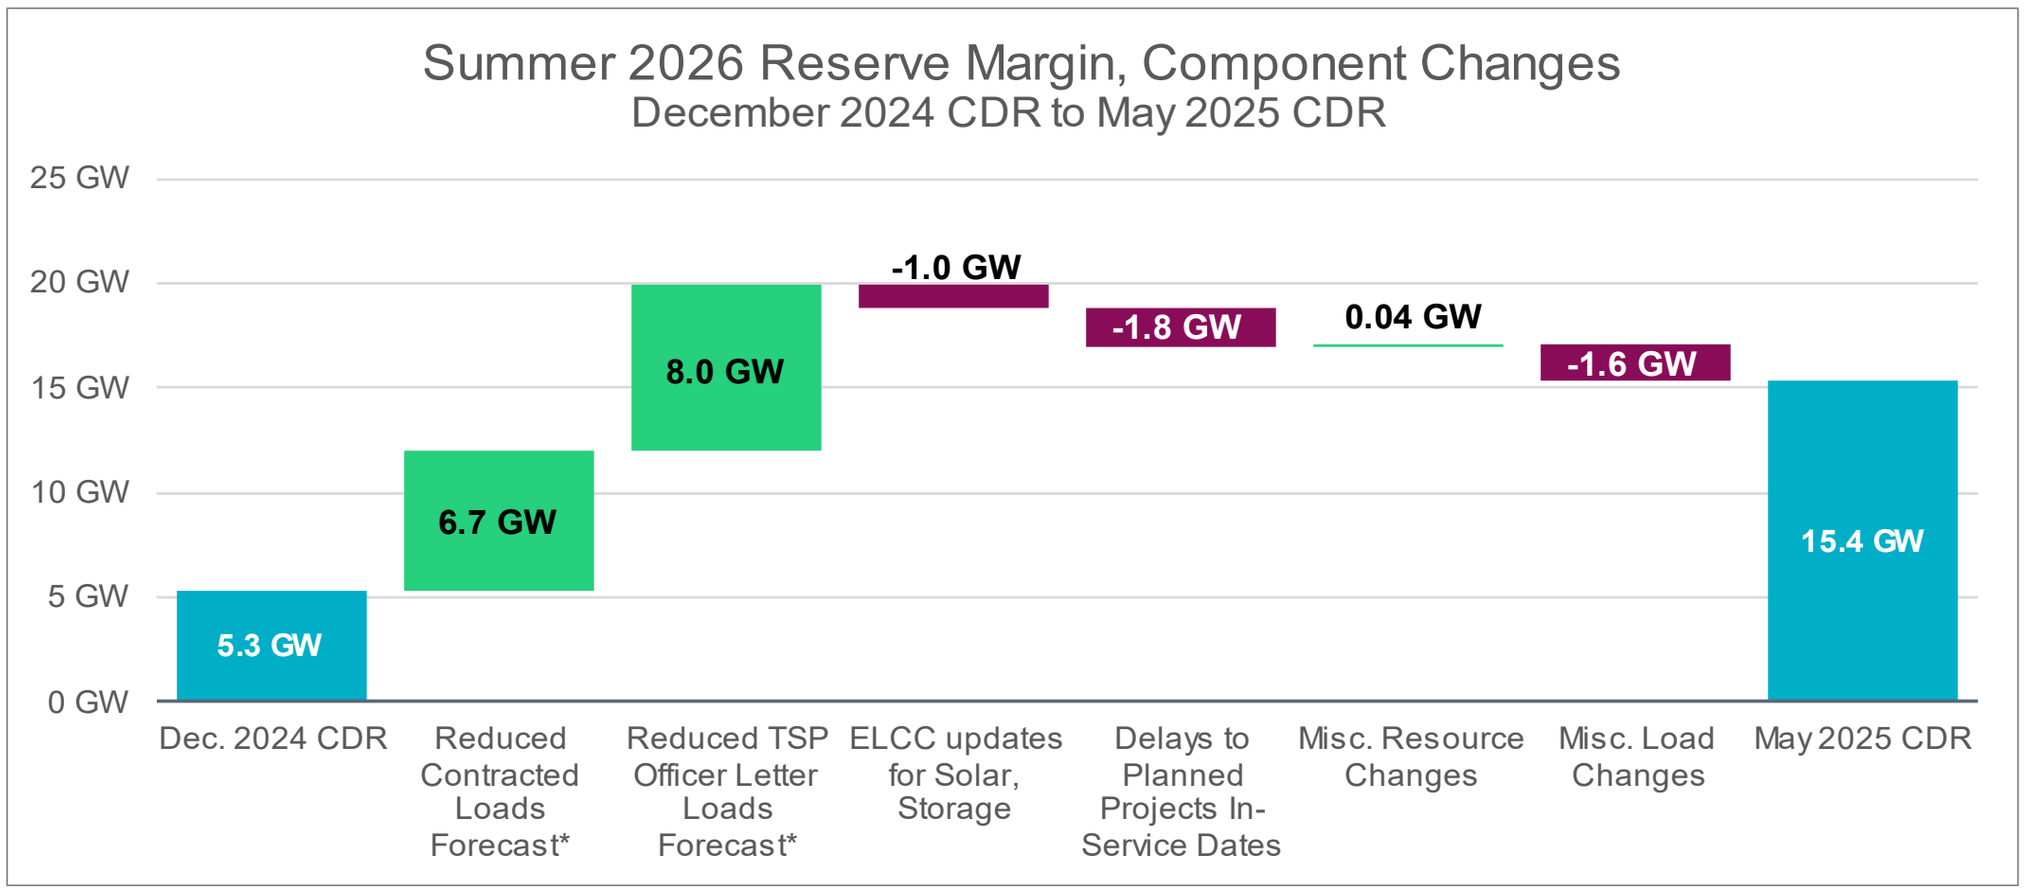
  Both the summer peak Load and peak Net Load enter negative territory beginning summer 2028. The reduction in the Large Load forecast, based on the ERCOT adjustments described above, drive the improved margins relative to the December 2024 CDR released in February. The significant drop in Data Center Loads, which use power at a consistently high level throughout the day, also produces a larger gap between the Loads at the time of the peak hour and net peak hour. For the winter, both peak Load and peak Net Load Margins enter negative territory beginning winter 2028/29. Unlike summer, the peak Net Load hour Margins are higher than the peak Load hour Margins. This flip is due to winter loads decreasing more proportionally to winter resource decreases, while summer loads decrease less proportionally to summer resource decreases.

  The lower and sharply downward trajectory of the Margins is due to (1) high load growth largely driven by new Loads reported by Transmission Service Providers, (2) a lower capacity contribution from wind and solar resources due to the switch to Effective Load Carrying Capabilities, (3) fewer planned resources that result from applying additional eligibility criteria to be included in Planning Reserve Margins.





- The following waterfall chart shows the Reserve Margin capacity components for summer 2026 that contribute to the differences in Planning Reserve Margins reported in the December 2024 CDR versus the May 2025 CDR. (Crimson bars signify components that reduce Reserve Margin capacity whereas green bars signify components that increase Reserve Margin capacity.)



Notes: *Reduced Contracted Loads and TSP Officer Letter Loads Forecast is based on ERCOT Adjusted Load Forecast methodology. https://www.ercot.com/gridinfo/load/forecast , https://www.ercot.com/files/docs/2025/04/22/2__SAWG_ERCOT_Long-term_Load_Forecast_4-25-2025.ppt

ELCC stands for Effective Load Carrying Capability. Delays to planned projects by fuel type are 136 MW Wind, 694 MW Solar, and 1,018 MW Storage.

Miscellaneous resource changes include rating adjustments to operational and planned resources, new planned projects, cancellations of planned projects, DG unit retirements, newly mothballed units (V H BRAUNIG STG 1 & 2), newly extended outage (R W MILLER STG 1), newly Unavailable Switchable Unit (TENASKA GATEWAY STATION STG 4) and updated forecasts for Private-Use Network (PUN) Capacity Contributions.

Miscellaneous load changes cover updates to Load Resource categories displayed in the Seasonal Summary tab, including Incremental Rooftop PV Forecast, Load Resources, Controllable Load Resources, Emergency Responsive Service, TDSP load management programs, and Distribution Voltage Reduction.

Planned Resource Trends

- The table below shows the changes in resource capacity additions for summer 2026-2030 by resource category. Only those projects that have met the CDR eligibility criteria are included. Solar is expected to continue out-pacing the other resource types in terms of installed capacity growth, followed by Energy Storage Resources (battery energy storage).

Planned Generation Installed Capacity Additions by Summer Season (Projects that meet CDR Eligibility Criteria)						
	Summer 2026	Summer 2027	Summer 2028	Summer 2029	Summer 2030	Trend
Thermal (Natural Gas and Diesel)	1,452	1,452	2,126	2,126	2,126	
Battery Energy Storage	9,469	13,642	16,768	17,324	17,324	
Dispatchable Total	**10,921**	**15,094**	**18,894**	**19,450**	**19,450**	
Solar	10,166	19,570	24,009	26,259	26,259	
Wind	1,177	3,368	4,650	4,650	4,650	
Non-Dispatchable Total	**11,343**	**22,938**	**28,659**	**30,909**	**30,909**	
Total	**22,264**	**38,032**	**47,552**	**50,358**	**50,358**	

Significant Resource Status Changes

- The Reliability Must Run (RMR) contract for CPS Energy's Braunig 3 unit was signed on February 24, 2025. The unit will start providing RMR service no sooner than Fall 2025 due to required repairs on the unit. Service will be provided through winter 2026/2027, and then the unit will be retired.

  On February 25, 2025, the ERCOT Board of Directors approved a plan to go forward with Life Cycle Power's (LCP's) "Mobile Generation Solution." The plan involves moving 15 mobile generators from the Houston to San Antonio area to help reduce reliability risk due to transmission constraints north of the City. (Aggregate capacity ranges from 333 MW to 466 MW based on typical high and low system-wide summer and winter temperatures, respectively.) The mobile generation contract would cover a maximum two-year period; however, ERCOT is working with CPS Energy on accelerating transmission projects that would allow the contract to potentially end sooner.

Load/Resource Forecast Uncertainty

- For this CDR, ERCOT includes four alternative Planning Reserve Margin scenarios in addition to the one based on the ERCOT Adjusted Load Forecast and Protocol-proscribed resources (Scenario 1). These four scenarios consist of variations in the amount of assumed TSP Officer Letter Loads and Texas Energy Fund (TEF) project capacity associated with projects that are in the ERCOT interconnection queue. These alternative scenarios are summarized below:
  - Scenario 2: 50% of all TSP Officer Letter Loads replaces ERCOT's Adjusted TSP Officer Letter Load amounts.
  - Scenario 3: 100% of all TSP Officer Letter Loads replaces ERCOT's Adjusted TSP Officer Letter Load amounts.
  - Scenario 4: Includes all Texas Energy Fund project capacity, 6,837 MW, reflected in the ERCOT interconnection queue that is not already in the CDR. Note that there are four new projects—a total of 1,934 MW—approved by the PUCT for due-diligence that are not yet in the queue and therefore not reflected in the scenario.
  - Scenario 5: Includes only Texas Energy Fund (TEF) projects in the ERCOT interconnection queue for which a Full Interconnection Study (FIS) FIS has been requested.

  These load and resource scenarios are provided in the following tab:

  Load-Resource Scenarios

Peak Load Hour Scenarios: Summer and Winter

Table 1: Summer Load and Resource Scenarios	Peak Load Hour 2026	2027	2028	2029	2030
Firm Peak Load -- ERCOT Adjusted, MW	**89,667**	**104,106**	**121,257**	**128,287**	**138,392**
TSP Officer Letter Load Scenario 1: 50% of TSP Officer Letter Loads replaces ERCOT Adjusted TSP Officer Letter Loads	93,140	113,091	135,085	147,473	155,242
TSP Officer Letter Load Scenario 2: 100% of TSP Officer Letter Loads replaces ERCOT Adjusted TSP Officer Letter Loads	99,347	129,495	165,706	187,893	200,315

(Total Resources - Firm Load Forecast) / Firm Load Forecast															

*Total Load consists of the following forecast components: Base Economic, Electric Vehicle Forecast, Large Flexible Loads forecast, and ERCOT Adjustments to Transmission Service Provider (TSP) forecasts.
The ERCOT adjustments to TSP-provided forecasts comprise the following:
– 180-Day Delay for Contracts and Officer Letter Load: ERCOT applies a 180-day delay to all contract and officer letter load forecasts provided by TSPs.
– All new data center load requests are reduced to 49.8% of the original request.
– All Officer Letter Load requests are reduced to 55.4% of the original request.

The rooftop PV forecast is shown as a separate adjustment to indicate the magnitude of this Distributed Generation resource.

(Total Resources - Firm Load Forecast) / Firm Load Forecast

*Total Load consists of the following forecast components: Base Economic, Electric Vehicle Forecast, Large Flexible Loads forecast, and ERCOT Adjustments to Transmission Service Provider (TSP) forecasts.
The ERCOT adjustments to TSP-provided forecasts comprise the following:
– 180-Day Delay for Contracts and Officer Letter Load: ERCOT applies a 180-day delay to all contract and officer letter load forecasts provided by TSPs.
– All new data center load requests are reduced to 49.8% of the original request.
– All Officer Letter Load requests are reduced to 55.4% of the original request.

The rooftop PV forecast is shown as a separate adjustment to indicate the magnitude of this Distributed Generation resource.

NOTES:

[1] Operational resources are those for which ERCOT has approved grid synchronization or full commercial operations as of mid-April 2025—when Resource data was collected for this CDR. Unit level details for each resource category can be found in the Resource Details tab.

[2] Installed capacity ratings are based on the maximum power that a generating unit can produce during normal sustained operating conditions as specified by the equipment manufacturer. All gas-fired Private-Use Network (PUNs) units are reflected in the combined cycle fuel type row above.

[3] Includes a small amount of hydro units that are considered intermittent resources (run-of-river DG hydro units).

[4] Planned resources consists of projects that meet the milestones found in the 'New CDR-Eligible Resources' tab

What is an Effective Load Carrying Capability?

ELCC measures the effectiveness of a resource type—wind, solar and battery energy storage—in maintaining a resource portfolio's reliability level over a given period. Reliability is measured as the expected frequency of loss-of-load (LOL) events, where an event represents an hourly period when rotating load shed is necessary to maintain overall grid reliability. The availability of the resource type when LOL events are more likely to occur determines the ELCC. ELCC is not a direct measure of generation output available for a given period, but rather an indicator of the expected reliability benefit of the capacity for the given period.

ELCCs estimated for the CDR reflect the resource reliability benefit for a given multi-hour "risk period" rather than an individual hour. The reason is that loss-of-load events can span multiple hours, which makes it impractical to calculate ELCCs for just a given hour.

Why has ERCOT changed its method for calculating the capacity contribution of wind and solar resources?

ELCCs estimated for wind, solar and battery energy storage—Inverter Based Resources, or IBRs—are now being used for ERCOT's CDR. ELCCs replace a methodology whereby average historical wind and solar capacity availability is estimated for a sample of the highest peak load hours during past seasons. This prior approach fails to account for the expected reliability impacts of increasing wind and solar penetration, resulting in reserve margins that belie the increased reliability risk for these intermittent resources. Importantly, the ELCC method aligns the CDR with how IBRs are represented in the probabilistic simulation model to be used to support analysis for the Texas Public Utility Commission's new Reliability Standard.

How are ELCCs Estimated?

A resource type's ELCC is gauged against so-called "perfect capacity," which is hypothetical generation capacity that is available 100% of the time when the capacity is needed. For example, a wind ELCC of 25% means that the resource portfolio's wind capacity is only 25% as effective as perfect capacity in maintaining the portfolio's reliability level for the given period. The associated ELCC capacity is the ELCC percentage multiplied by the resource type's aggregate installed capacity in megawatts (MW).

ELCCs are determined by running a probabilistic reliability model for a future year. The model produces many reliability outcomes for the forecast year based on simulating grid conditions with variations in load and resource availabilities. ELCCs account for a resource type's average reliability contribution across all the simulation outcomes.
The basic process for estimating ELCCs is as follows:
1. The future-year resource portfolio is first modified to meet a reliability level based on the reliability criteria established for a prevailing reliability standard.
2. All the capacity for the resource type is then removed and replaced with perfect capacity until the reliability level is again reached based on simulation results. (The perfect capacity is a gas turbine plant with a zero-percent outage rate).
3. The final step is to divide the perfect capacity added by the capacity of the resource type removed. The result is the ELCC percentage. ELCCs will aways be less than 100%.

ELCC study reports are available in the "Wind, Solar and Energy Storage Resources" section of ERCOT Resource Adequacy webpage.

Key Attributes of ELCCs

Annual ELCCs can be decomposed into values for shorter periods. ERCOT's ELCCs are estimated by year, season, and daily risk period (afternoon and evening for non-winter months; morning, afternoon, and evening for winter months.)

ELCCs decline as more of the resource type is added to the resource portfolio. When there is not much of the resource type installed on the grid, its capacity yields a high ELCC. However, adding more capacity dilutes the reliability benefit of the existing and new capacity, thereby lowering the ELCC. This effect is most dramatic for solar capacity. At low penetration levels, solar has a large reliability benefit in the afternoon when solar output is at its highest. As more solar is added, the risk of reliability issues is then pushed into the evening hours when solar generation drops and becomes much less effective at maintaining reliability. Solar ELCCs decrease sharply for the evening risk period, but also decrease for the afternoon.

ELCCs for a resource type account for the joint reliability impacts of other portfolio resources and the grid conditions modeled. Resource diversity can have benefits for maintaining a given portfolio reliability level. For example, the combination of solar and battery energy storage can provide a combined ELCC greater than adding the ELCCs estimated separately for these resource types. This synergistic reliability effect is captured by running simulations designed to isolate the incremental ELCC increase of the combined solar/battery resource portfolio. *ELCCs also reflect all modeled grid conditions that impact the timing, length and magnitude of LOL events.*

ELCCs are unique for a given set of portfolio resources, load forecasts, and other modeling assumptions. ELCCs typically need to be re-estimated as resource portfolios and other grid attributes affecting reliability change. To minimize the frequency of needed updates, a library of ELCCs has been developed based on a range of future resource-type combinations and load levels. This library development approach supports ELCCs calculated for the range of planning reserve margin periods reported in the CDRs.

ELCCs for battery energy storage systems (BESSs) are estimated for a range of design durations. BESS ELCCs are impacted by system duration; the longer the duration, the higher the ELCC, not accounting for the "diminishing returns" effect of adding more BESS capacity to the resource portfolio. Estimating BESS-duration ELCCs is more complicated than estimating them for wind and solar capacity, requiring both probabilistic modeling and a separate model to estimate all the reliability impacts of these systems.

ELCCs Values used in this CDR

The following table lists the wind, solar and battery energy storage Effective Load Carrying Capability (ELCC) values used for Planning Reserve Margin calculations. ELCC values are disaggregated by time periods: forecast year, season and applicable reserve risk period. Unlike the summer and winter seasons, there currently isn't sufficient LOL events surfaced by the probabilistic reliability simulation model for the spring and fall seasons to provide meaningfully distinct ELCCs. Therefore, ELCCs for the winter evenings are used as proxies for the spring season, and summer afternoon ELCCs are used as proxies for the the fall.

*ELCCs for non-winter morning reserve risk periods are not reported because the occurrence of loss-of-load events is expected to be negligible or non-existent for those periods.

New Planned Resources Eligible for CDR Report since the Last CDR Report, Published Feb. 2025

The table below lists the planned resources that have met certain ERCOT Planning Guide criteria necessary for the resources to be included in this CDR report. These criteria are as follows:

Large Generators
1. For all resource types a signed Standard Generation Interconnection Agreement (SGIA) or other binding agreement (for municipally-owned utilities or electric cooperatives).
2. Air permits required by the Texas Commission on Environmental Quality (TCEQ) or notice that air permits are not required.
3. Submission of a "Declaration of Adequate Water Supplies" and proof that the resource has sufficient water supplies for electricity generation. Solar, wind, and Energy Storage Resources are exempt from this requirement.
4. Provided the required financial security for interconnection facility construction and that the TDSP has received a notice to proceed with interconnection construction.

See ERCOT Planning Guide Section 6.9(1)(d)(ii)(B).

Small Generators
1. ERCOT has determined that all data submission requirements for Resource Registration have been met and the generator is added to the ERCOT Network Operations Model. These requirement are met when the Small Generator has been issued a Model Ready Date.

Notes

Year of Projected Commercial Operations: The year is based on the projected Commercial Operations Date (COD) reported by the project developer.

Planned projects with a "(DGR)" suffix indicate that the resource is a Distributed Generation Resource as defined in the ERCOT Nodal Protocols (Section 2.1).

Projects ending with 'SLF' represent Battery Energy Storage Systems that are Self-Limiting Facilities (SLFs), where the MW capacities are reported as zero to reflect projects for which the battery system is sized to be less than the total nameplate capacity of all registered generators at the facility. Other generators at the facility typically include one or more inverter-based resources, such as solar.

Acronyms

General

GIM = Generator Interconnection or Modification request
CDR = Capacity, Demand and Reserves Report
COD = Commercial Operations Date
ELCC = Effective Load Carrying Capability
HE = Hour Ending
INR = Interconnection Request Number
RIOO-IS = "Resource Integration and Ongoing Operations - Integration Services" system
RIOO-RS = "Resource Integration and Ongoing Operations - Registration Services" system
RTP = Regional Transmission Plan
TSP = Transmission Service Provider

CDR Status (For Unit Details table)

EXT-OUT = Extended outage
OPER = Operational
OPER-SLF = Operational Self-Limiting Facility (See the Definitions tab for the SLF definition)
OPER-SYN = Operational, synchronized only
OPER-UNR = Unconfirmed Planned Retirement
OPER-UNFC = Unconfirmed Fuel Conversion
MOTH-SEA = Seasonal mothballed (Unit operating under a seasonal availability schedule)
MOTH-IND = Indefinitely mothballed
PLAN = Planned
PLAN-RPR = An existing unit being repowered and required to submit an interconnection request (See the Definitions tab for the CDR repower definition)
RMR = Reliability Must-Run, A generation resource unit operated under the terms of an agreement with ERCOT that would not otherwise be operated except that they are necessary to provide voltage support, stability or management of localized transmission constraints under first contingency criteria.

CDR Resource Attributes (For Unit Details table)

CONV = Conventional generation resource (Unit that does not fall under the other CDR Attribute categories)
DC-TIE = Direct Current Asynchronous Tie
DGR = Distributed Generation Resource
PUN = Private Use Network generator
PUN-AGR = Aggregate PUN resource, used for reporting the aggregate PUN capacity contribution
SLF = Self-Limiting Facility (See the Definitions tab for the SLF definition)
SODG = Settlement Only Distribution Generator
SWGR-AVA = Switchable Generation Resource, available
SWGR-UNA = Switchable Generation Resource, Unavailable

Fuel Types (For Unit Details Table)

BIOMASS = Biomass
COAL = Coal (bituminous, subbituminous, lignite)
DIESEL = Fuel Oil
GAS = National Gas
GEO = Geothermal
HYD = Hydrogen
HYDRO = Water
MWH = Direct Current Asynchronous Tie
NUCLEAR = Nuclear
OTH = Other
PET = Petroleum Coke
SOLAR-FW = Solar from the Far West CDR solar region
SOLAR-O = Solar from the Other CDR solar region
SOLAR-W = Solar from the West CDR solar region
STORAGE = Storage
WIND-C = Wind from the Coastal wind region
WIND-O = Wind from the Other wind region
WIND-P = Wind from the Panhandle wind region

Technology Types (For Unit Details table)

BA = Battery Energy Storage
CC = Combined-Cycle
CE = Compressed Air Energy Storage
CP = Concentrated Solar Power
EN = Energy Storage
FC = Fuel Cell
GT = Combustion (gas) Turbine, but not part of a Combined-Cycle
HY = Hydroelectric Turbine
IC = Internal Combustion Engine, e.g. Reciprocating
MWH = Direct Current Asynchronous Tie
OT = Other
PV = Photovoltaic Solar
ST = Steam Turbine other than Combined-Cycle
WT = Wind Turbine

Definitions

Available Mothballed Capacity based on Owner's Return Probability
Mothballed capacity with a return-to-service probability of 50% or greater for a given season of the year, as provided by its owner, constitutes available mothballed generation. Return probabilities for individual units are considered protected information under the ERCOT Protocols and therefore are not included in this report.

Capacity Pending Retirement

Announced retired capacity that is undergoing ERCOT grid reliability reviews pursuant to Nodal Protocol Section 3.14.1.2.

Contracted / Non-Contracted TSP Loads

Contracted Large Load: A Large Load, as defined in ERCOT's Planning Guide, reported to ERCOT for which an interconnection agreements and/or Facility Extension Agreements (FEA) has been signed by the customer and Transmission Service Provider, and the customer share of costs for the extension of TSP facilities has been paid to the TSP. A contracted Load typically falls into the following general categories: crypto-mining, data centers, hydrogen/ammonia production, oil and gas production, and industrial/manufacturing.

Officer letter Large Load: A Load (or Loads) for which an officer of a TSP has documented in a letter sent to ERCOT attesting that there is a high likelihood that the Load(s) will materialize. These prospective Loads are not associated with a signed interconnection agreement or FEA, and are therefore considered more speculative than Loads with a signed interconnection agreement or FEA.

Decommissioned Generation Resource

A Generation Resource for which a Resource Entity has submitted a Notification of Suspension of Operations (NSO) or a Notification of Change of Generation Resource Designation (NCGRD), for which ERCOT has declined to execute a Reliability Must-Run (RMR) Agreement, and which has been decommissioned and permanently retired.

Distribution Resource Types:

Settlement Only Distribution Generator (SODG)

A generator that is connected to the Distribution System with a rating of:
(1) One MW or less that chooses to register as an SODG; or
(2) Greater than one and up to ten MW that is capable of providing a net export to the ERCOT System and does not register as a Distribution Generation Resource (DGR).

Distribution Generation Resource (DGR)

A Generation Resource connected to the Distribution System that is either:
(1) Greater than ten MW and not registered with the Public Utility Commission of Texas (PUCT) as a self-generator; or
(2) Ten MW or less that chooses to register as a Generation Resource to participate in the ERCOT markets.

Effective Load Carrying Capability (ELCC)

Represents the aggregate average Megawatt (MW) contribution of a resource class in maintaining a target level of resource reliability for a given resource portfolio and forecast period. ELCCs are developed using Monte Carlo system simulation techniques to capture a wide range of system reliability outcomes. ELCC derivation starts with a base portfolio constructed to achieve the target reliability level. The resource class (e.g., wind) is removed and substituted with capacity that has perfect availability until the target reliability level is again reached. The ELCC is the amount of perfect capacity added divided by the amount of the resource class capacity removed, expressed as a percentage.

Emergency Response Service

ERCOT uses the methodology specified in Protocol Section 3.2.6.2.1, Peak Load Estimate, to derive the ERS capacity forecast for future years. The Current Year for the calculations is defined as the latest year for which ERS has been procured. The ERS capacity amounts are grossed up by 2% to reflect avoided transmission line losses.

Energy Efficiency Program Savings Forecast

ERCOT's energy efficiency forecast uses the PUCT's annual verified energy efficiency program savings estimates as the starting point. (See the definition for verified energy efficiency program savings below.) Savings from TDSP standard offer load management programs are not included in the ERCOT energy efficiency forecast. ERCOT calculates the historical average annual verified savings while excluding 2017 from the computation due to the load impacts caused by Hurricane Harvey. (For prior forecasts, ERCOT used a formula based on the State energy efficiency goals in Utilities Code Section 39.905. Since the impacts of the goals were assumed to accumulate for just seven years from the time that the goals must be first met (2013), ERCOT no longer uses the goal-based forecasting approach.)

Energy Emergency Alert (EEA)

An ERCOT EEA declaration is made when operating reserves and system frequency drop below established severity levels (Levels 1, 2 and 3) and reserves are not projected to recover within 30 minutes unless certain actions are taken. An EEA declaration initiates an orderly, predetermined procedure for maximizing the use of available Resources, including the use of voluntary load reduction programs that are only available under EEA operations. Only under the most severe EEA level, would ERCOT direct Transmission and Distribution Service Providers to start shedding Load on a rotating basis in order to maintain system reliability and integrity. See Nodal Protocol Section 6.5.9.4, Energy Emergency Alert, for more details.

ERCOT Contingency Reserve Service (ECRS)

An Ancillary Service that provides operating reserves that is intended to:
(a) Restore Responsive Reserve (RRS) within ten minutes of a frequency deviation that results in significant depletion of RRS by restoring frequency to its scheduled value to return the system to normal;
(b) Provide energy or continued Load interruption to avoid or during the implementation of an Energy Emergency Alert (EEA);
(c) Provide backup regulation; and
(d) Be sustained at a specified level for two consecutive hours.

Forecast Zone

The CDR report uses Forecast Zones to identify the geographical location of generation resources. Forecast Zones generally have the same boundaries as the 2003 Congestion Management Zones with the following exceptions: A) Panhandle Zone for resources in the Texas Panhandle counties and outside the 2003 Congestion Management Zones, and B) Coastal Zone for resources in 11 counties along the Texas Gulf Coast and formerly in the South Zone of the 2003 Congestion Management Zones. There are six Forecast Zones: Coastal, Houston, North, Panhandle, South, and West.

Full Interconnection Study (FIS)

The set of studies conducted by a Transmission Service Provider (TSP) for the purpose of identifying any electric system improvements or enhancements required to reliably interconnect a new All-Inclusive Generation Resource consistent with the provisions of Planning Guide Section 5, Generation Resource Interconnection or Change Request. These studies may include steady-state studies, system protection (short-circuit) studies, dynamic and transient stability studies, facility studies, and sub-synchronous oscillation studies.

Hydroelectric, Peak Average Capacity Contribution

Hydroelectric, Peak Average Capacity Contribution listed in the Seasonal Summary tab is based on average of the power that can be provided by hydroelectric generators during the during the highest 20 peak Load hours for each preceding three-year period for each Reserve Risk Period.

Inactive Projects

Per Planning Guide Section 5.7.6, a proposed Resource shall be given the status of “Inactive” if the Resource has not met the conditions for inclusion in the ERCOT planning models, as specified in Section 6.9, Addition of Proposed Generation to the Planning Models, within two years of the date on which ERCOT posts the final FIS studies for the Resource to the MIS Secure Area. A developer may also elect Inactive status and stop any interconnection studies in process at its own discretion. When an Inactive Resource subsequently meets the requirements of Section 6.9, it shall be added to the planning models and the status changed back to Planned. If a Resource has been Inactive for five years, ERCOT may cancel the project pursuant to Planning Guide Section 5.7.7, Cancellation of a Project Due to Failure to Comply with Requirements.

Installed Capacity Rating

The installed capacity rating is the maximum power that a generating unit can produce during normal sustained operating conditions as specified by the equipment manufacturer. ERCOT uses Real Power Ratings that reflect the continuous flow of power to loads (as opposed to reactive power, which is the power that flows back and forth between the power source and loads, and doesn't perform useful work.)

Large Flexible Load (LFL)

A Large Load (as defined below) that can come online quickly and is very responsive to real time prices. An LFL is typically a crypto-currency mining site.

Large Load

One or more Facilities at a single site with an aggregate peak Demand greater than or equal to 75 MW behind one or more common Points of Interconnection (POIs) or Service Delivery Points.

LRs (Load Resources)

Load capable of reducing or increasing the need for electrical energy or providing Ancillary Services to the ERCOT System, as described in the ERCOT Protocols, Section 6, Ancillary Services. These Resources may provide the following Ancillary Services: Responsive Reserve Service, Non-Spinning Reserve Service, Replacement Reserve Service, and Regulation Service. The Resources must be registered and qualified by ERCOT and will be scheduled by a Qualified Scheduling Entity (QSE). LR capacity has been grossed up by 2% to reflect avoided transmission line losses.

Mothballed Unit

A generation resource for which a generation entity has submitted a Notification of Suspension of Operations, for which ERCOT has declined to execute an RMR agreement, and for which the generation entity has not announced retirement of the generation resource. A seasonal mothballed unit is one in which the generation entity requests a seasonal operation period that must include the summer Peak Load Season, June 1 through September 30.

Mothballed Capacity

Capacity that is designated as mothballed by a generating unit's owner as described above, and which is not available for operations during the summer Peak Load Season (June, July, August and September) or winter Peak Load Season (December, January and February).

Seasons

Summer months are June, July, August, and September; winter months are December, January, and February.

Net Load / Peak Net Load

The Load for a given period minus generation from PhotoVoltaic Generation Resources (PVGRs) and Wind Generation Resources (WGRs) for the same period. The peak Net Load is the highest value for the given period.

Private Use Networks (PUNs)

An electric network connected to the ERCOT transmission grid that contains load that is not directly metered by ERCOT (i.e., load that is typically netted with internal generation).

The Capacity from Private Use Networks forecast estimate in the Seasonal Summary tab is based on the average available power during the seasonal peak days over the past three years, and it is adjusted for any reported changes in capacity at the start of the forecast season.

Non-Synchronous Tie

Any non-synchronous transmission interconnection between ERCOT and non-ERCOT electric power systems.

Reliability Must-Run (RMR) Unit

A generation resource unit operated under the terms of an agreement with ERCOT that would not otherwise be operated except that they are necessary to provide voltage support, stability or management of localized transmission constraints under first contingency criteria.

Repower

For CDR reporting purposes, a repower is an operational resource for which the owner plans to modify it where one of the two following conditions apply:

- The Resource Entity is changing the inverter, turbine, generator, or power converter associated with a facility with an aggregate real power rating of ten MW or greater, unless the replacement is in-kind; See Planning Guide Section 5.2.1(1)(c)(ii).
- Increasing the aggregate nameplate capacity of a generator less than ten MW to ten MW or greater. See Planning Guide Section 5.2.1(1)(c)(v).

Self-Limiting Facility (SLF)

A modeled generation station that includes one or more Generation Resources, Energy Storage Resources (ESRs), and/or Settlement Only Generators (SOGs) with an established limit on the total MW Injection that is less than the total nameplate capacity of all registered generators or Energy Storage Systems (ESSs) within the Facility. A Facility with one or more ESRs may also have an established limit on the MW Withdrawal that is less than the total nameplate MW Withdrawal rating of all ESRs within the facility. (MW Withdrawal is defined as the instantaneous Megawatt (MW) energy withdrawn from the ERCOT System as measured at the Point of Interconnection (POI) or Point of Common Coupling (POCC).

Signed SGIA (Standard Generation Interconnection Agreement)

An agreement that sets forth requirements for physical connection between an eligible transmission service customer and a transmission or distribution service provider.

Switchable Generation Resource (SWGR)

A generation resource that can be connected to either the ERCOT transmission grid or a grid outside the ERCOT Region.

Synchronized but not Approved for Commercial Operations Capacity

These units have met requirements to Energize Equipment (Part 1 of Generator Commissioning Checklist): provided latest model data, verified Voltage Ride-Through capability and communication capabilities specified by ERCOT Operating Guides are in place. Output for these resources is not limited once they have passed a curtailment test and the project developer has submitted an attestation for the following plant controls: Automatic Voltage Regulator (AVR), Primary Frequency Response (PFR), Voltage Support Service (VSS), and Power System Stabilizer (PSS).

A Synchronized unit get approved for Commercial Operations after the plant controls have been verified by ERCOT.

More information on Synchronized units can be found in the Resource Interconnection Handbook pages 24 – 33.http://www.ercot.com/content/wcm/lists/168284/Resource_Interconnection_Handbook_v1.91_01082021.docx

TDSP Standard Offer Load Management Programs

For the May releases of the CDR report, ERCOT uses the megawatt amount of verified peak load capacity reductions, adjusted for avoided transmission losses, due to TDSP Standard Officer load management programs that are reported by electric utilities in the ERCOT Region to the Public Utility Commission of Texas. The reported amounts are for the most current reporting year, which is the calendar year prior to the year during which the May CDR is prepared. (For example, the May 2019 CDR report used verified program savings for the 2018 reporting year.)

For the December CDR releases, ERCOT uses TDSP data received for the current load management program year, which is more timely than the verified savings estimates provided to the PUCT. The data obtained from the TDSPs reflect verified program performance for the summer based on testing, and is adjusted for avoided transmission losses.

Unconfirmed Retirement

The capacity of Generation Resources for which a public announcement of the intent to permanently shut the unit down has been released, but a Notice of Suspension of Operations for the unit has not been received by ERCOT. To be considered an Unconfirmed Planned Retirement, the Generation Resource must meet the following criteria: (1) a specific retirement date is cited in the announcement, or other timing information is provided that indicates the unit will be unavailable for a given season and year, and (2) the announcement, with follow-up inquiry by ERCOT, does not indicate that retirement timing is highly speculative.

Verified Energy Efficiency Program Savings

The total megawatt (MW) amount of verified peak load capacity reductions due to residential and commercial sector energy efficiency incentive programs that are reported by electric utilities in the ERCOT Region to the Public Utility Commission of Texas. See Utilities Code Section 39.905. Note that savings from TDSP standard offer load management programs are not included in the ERCOT energy efficiency forecast, but rather handled as a separate reporting line item.

Wind and Solar Regions

See the "Wind-Solar Region Mapping" tab to see which counties are assigned to each region.

The assigned Wind Region for each wind generation resource is indicated as "WIND-C," "WIND-P," or "WIND-O" in the Fuel columns of the summer/winter Capacities tabs. The assigned Solar Region assigned to each solar generation resources is indicated as "SOLAR-W," SOLAR-FW," and SOLAR-O."

The tables below show what counties in the ERCOT region are mapped to the CDR Wind and Solar Regions.

Note: The CDR Wind and Solar Regions are intended to facilitate calculation of geographic-based Effective Load Carrying Capabilities (ELCCs) that represent wind and solar availabilities for Planning Reserve Margin calculation purposes. These are distinct from ERCOT zone definitions defined for other uses, such as the zones used for wind and solar production forecasting and reporting.

CDR Report Background

The main purpose of the CDR is to provide forecasted Planning Reserve Margins by season and year. The Planning Reserve Margin represents the percentage of resource capacity, in excess of firm electricity demand, available to cover uncertainty in future demand, generator availability and new resource supply. Firm demand accounts for load reductions available through interruptible load programs controlled by ERCOT as well as incremental load reductions from rooftop solar systems. The methodologies used to develop Planning Reserve Margins and other elements of the CDR are outlined in the ERCOT Nodal Protocols, Section 3.2.6 (See https://www.ercot.com/mktrules/nprotocols/current). ERCOT's load forecasts are based on normal weather conditions and determined by the methodologies described in the methodology documents posted to the Load Forecast webpage, https://www.ercot.com/gridinfo/load/forecast. The CDR also conforms to requirements for resource adequacy reporting specified by the Public Utility Commission of Texas in their Substantive Rules, §25.505(b).

Resource data comes from generation capacity developers (Interconnecting Entities, IEs) and owners as reported in ERCOT's Resource Integration and Ongoing Operations (RIOO) system, as well as other data collection mechanisms described in the ERCOT Nodal Protocols.

Note that the CDR is not intended for characterizing the risk of capacity scarcity conditions from a real-time operations perspective.

Report Changes Introduced by Nodal Protocol Revision Requests 1219 and 945

Peak Net Load Information: Planning Reserve Margin (PRMs) and associated loads and resource information are added for the forecasted peak Net Load hour by year and season.

Shift to Effective Load Carrying Capabilities (ELCCs): Instead of using peak average capacity contributions for wind and solar resources, the CDR is now utilizing ELCCs to represent their availabilities. ELCCs are also estimated for battery energy storage systems.

Expanded Reporting Timeframe: The report will now include PRMs, associated loads, and resources for all four seasons (summer, winter, spring, and fall). Previously, only summer and winter seasons were included.

Introduction of New Solar Regions: Three new solar regions (West, Far West, and Other) are introduced to enable more accurate solar capacity availability forecasts. Previously, a single system capacity availability forecast was used.

Updated Criteria for Planned Resources: The criteria for including planned resources in the CDR has been expanded to include ERCOT notification that a project developer has provided the required financial security for interconnection facility construction and that the TDSP has received a notice to proceed with interconnection construction. See ERCOT Planning Guide Section 6.9(1)(d)(ii)(B).

Inclusion of Publicly Announced Planned Retirements: A new category for planned retirements has been added to account for Generation Resources associated with publicly announced retirement plans, but their Resource owners haven't yet submitted a formal Notification of Suspension of Operations (NSO) to ERCOT.

Inclusion of Distribution Voltage Reduction (DVR): Distribution voltage reduction is now included as a load-reducing adjustment for Firm Peak Load calculation.

Inclusion of Energy Storage Resources (ESRs): Existing and planned ESRs are factored into the PRM calculations as available capacity. Battery ESRs are also categorized based on their maximum (or design) duration capabilities.

Revised Emergency Response Service (ERS) Methodology: The methodology for estimating forecasted ERS capacity has been modified to match the most recent ERS procurement amounts and allow ERCOT to make adjustments based on anticipated ERS program changes. This approach avoids unrealistic forecasted year-to-year volatility caused by averaging three-year historical ERS amounts.

Elevated Probability-of-Return Threshold for Mothballed Generation Resources: The threshold for including mothballed Generation Resources in the PRM calculations has been raised from 50% to 75%.

Identification of Individual Private Use Network (PUN) generators: Implementation of NPRR945 is expected by the end of 2024. This Protocol change requires ERCOT to post a monthly report identifying all generators that are part of a PUN, their nameplate capacities, and the date upon which they can be included in the report. This reporting requirement allows PUN generators that contribute to CDR Reserve Margins to be listed in the Unit Details tab along with their capacities. However, ERCOT will continue reporting the PUN capacity contribution as an aggregate value in a separate line item.

Other Methodology Changes

Planned Fuel Conversion Projects Previous Treated as Unconfirmed Retirements: To reflect the impact of planned fuel conversion projects for which a public announcement has been made, or the project is in the interconnection study queue but doesn't meet the planned project eligibility criteria for inclusion in the CDR, a new status designation, OPER-UNFC (unconfirmed planned fuel conversion for an operating unit), has been created. The original unit line item plus a new line item with OPER-UNFC represents the before-and-after unit status, respectively. The OPER-UNFC line item indicates the first season for which the converted unit is available, the new fuel type, and the new seasonal MW capability.
